The contract makes it clear that coal suitable for the operating of an iron and steel plant is the basis of the bargain.

The defendant company proved that Dominion No. 6 and its workings are on the Phalen Seam.

It also established that No. 6 coal was fit for steam purposes and capable of being consumed in grates and furnaces, and the judge finds that coal from No. 6 pit was commercial coal.

The coal received by the Steel Company was carefully mined and picked but not reasonably free from stone and shale.

The rejected coal from No. 6 contained 15.63 ash and sulphur 6.63. The average of the coal delivered in the preceding year from other pits on the same seam was 2.3 sulphur and 7 per cent. ash.

The exact and only thing the parties intended was that coal should be furnished to operate an iron and steel plant.

Coal to operate an iron and steel plant must be coal with which such a plant can be operated.

The objects of courts is "to give efficacy to the transaction and prevent such a failure of consideration as cannot have been in the contemplation of the parties."

The Coal Company committed a breach of the contract and is liable to the Steel Company for all the loss and damage which result from this breach.

A referee should be appointed to ascertain and determine the damages.

The contract of October 20th, 1903, is in full operation, and the judge orders that after the damages are assessed a decree issue requiring the Coal Company to specifically carry out the terms of the contract.

The court has power to enforce such decree by the appointment of a receiver if any attempt were made to evade specific performance.

COAL BRIQUETTING IN THE UNITED STATES*

By Edward W. Parker, Washington, D.C.

(Toronto Meeting, July, 1907.)

[Note.—The material from which this paper has been prepared was collected for the *U. S. Geological Survey Bulletin,* Contributions to Economic Geology, 1906, and appears also, though in somewhat more extended form without illustrations, in that publication.]

Although the briquetting of coals and lignites has been carried on for many years in Europe, and has reached a particularly high state of development in France, Belgium and Germany, it has made comparatively little progress in the United States. The causes for the backwardness of the United States in this regard are several, and first among them has been the abundant supply of cheap raw fuel with which the manufactured article has to compete. With our millions of acres of coal-productive territory, from which the production can in most cases be cheaply extracted, it has appeared in many districts to be more economical to waste the slack or culm, which constitutes a considerable percentage of the product, than to attempt to save it at the additional expense required for briquetting. It is for this reason that the view in all sections of the anthracite region of Pennsylvania is marred by the unsightly culm banks which encumber the ground, and that in some of the bituminous districts one sees huge piles of unmarketable slack allowed to burn up in order to get ride of them. When the coal is of a coking quality, or when the slack can be used for steaming purposes, these losses are not sustained, but many thousands of tons of what might be converted into usable fuel have been wasted every year simply because of the increased expense involved in its preparation.

The rational development of the briquetting industry has also been retarded by the attempts to exploit patented or secret processes for which all kinds of extravagant claims have been made, but which have almost invariably proved expensive and unprofitable, and the investment of capital in enterprises of this character accordingly has been discouraged. The Patent Office records teem with patents issued on all sorts of inventions relating to binders, many of which are as fanciful as the idea of perpetual motion.

Another reason for the failure to build up a briquetting industry in the anthracite region of Pennsylvania, where the best opportunity for its development is offered, has been the opposition shown by some of the operators to the introduction of a manufactured domestic fuel which would come into competition with the prepared sizes of anthracite. And such an opposition is natural. The competition of bituminous coal has almost entirely shut out anthracite as a steam fuel. The use of coke has supplanted the use of anthracite for iron-making, and the use, for domestic purposes, of coke and gas made from bituminous coal is growing. Owing to the greater depths to which the mining of anthracite is being carried, the thinner and less favorably located beds which are being worked, and to the increasing tendency in labor cost, the mining and preparing of anthracite are constantly becoming more expensive on one hand, while competition is becoming more keen on the other. A certain rate of production must be kept up for the protection of the properties themselves, and when all these conditions are considered, the unfavorable attitude on the part of the operators toward further competition is at least realizable.

Still another reason which has been assigned, rightly or wrongly, for our halting progress in fuel-briquetting has been the lack of assurance of a regular supply of coal tar pitch at reasonably low prices. Out of the many, and sometimes costly, attempts that have marked the incubating period of briquetting development has grown the knowledge that coal tar pitch must be relied upon to supply, in the Eastern States at least, all, or the greater part, of the binding material. In California, Arizona, and other parts of the far West, asphaltic pitch, the residual product from the refining of the heavy asphaltic base petroleums of that region, has been, and is now, successfully used in recently constructed briquetting plants. But in the East, coal tar pitch is the base of the economically successful cementing material. The extended investigations carried on at the United States Geological Survey coal testing plant at St. Louis bear out this statement.[1] These investigations included experiments with all kinds of organic and inorganic binders, embracing, besides coal tar pitch, such materials as rosin, sugar-house refuse, molasses, acid sludge, quicklime, and various mixtures. The results show that either coal tar or asphaltic pitch are the only really successful binders. Any materials used with them must possess above all others the essential virtue of cheapness.

But while it is claimed that the briquetting industry has been held back by the lack of assurance of a steady supply of coal tar pitch, it also happens that one of the reasons assigned for the comparatively slow development of the by-product coking ovens in the United States in the last few years is due to the lack of a profitable demand for coal tar, one of the principal by-products of the retort coke ovens. It is well known that the demand for creosoting oils to be used for the preservation of ties, bridge timbers, etc., by the railroad companies is far beyond the present domestic production of that coal tar product, and the statistics compiled by the Bureau of Statistics, Department of Commerce and Labor, show that our imports of the chemical products of coal tar exceed $10,000,000 in value yearly. To the ordinary observer it would appear that the conditions here presented afford an opportunity for the organization of a community of interests which would prove profitable to the projectors and beneficial to the general public. The constantly increasing expense involved in the mining and preparation of anthracite coal is making that commodity slowly but surely more and more of a luxury, and manufactured fuel which will take the place of anthracite for domestic use, particularly among consumers of moderate means, appears to be needed. This is especially true in the northeastern section of the United States.

Two of the briquetting plants recently constructed, and which are discussed in more detail in the following pages, indicate somewhat of a "getting together" of the coal tar producing and the briquetting interests. These are the plants of the United Gas Improvement Company, at Point Breeze, Philadelphia, and of the Semet-Solvay Company, at Del Ray, Mich. Both companies are producers of coal tar, and the plants have

*Published by permission of the Director of the U. S. Geological Survey.

been constructed for the purpose of briquetting mixtures of anthracite culm and coke breeze.

It appears now, moreover, that the period of failure and discouragement has passed, and that the manufacture and use of briquetted fuel is being placed upon a substantial footing. The first successful plant in the United States of which I have any definite knowledge was one built to Stockton, Cal., a few years ago by the San Francisco & San Joaquin Coal Company. This plant, unfortunately, was entirely destroyed by fire in 1905, and the plans for its reconstruction, this time at San Francisco, were interrupted by the earthquake and fire which destroyed a large portion of that city in April, 1906.

During the past two years a number of briquetting plants have been constructed, and as complete descriptions of them as it has been possible to obtain are given in the subsequent pages. Some of them have been put in operation since January 1st, 1907.

New York, N.Y.

New Jersey Briquetting Company.—During 1904 and 1905 the New Jersey Briquetting Company of New York constructed at the foot of Washington street, in Brooklyn, a plant for exploiting the briquetting process of the Zwoyer Fuel Company. This plant was intended to be operated in connection with a coal yard on Adams street, but during the construction of the piers and anchorages for the new Manhattan bridge the company was prohibited from operating the tramway from the coal yard to the plant. This naturally interfered with the operations of the plant, and as extensive storage capacity, either for raw material or for the product, had not been provided for, the work already done has been accomplished under much disadvantage. The prohibition put upon the tramway, and the lack of dock facilities for loading and unloading material, have crippled the palnt to such an extent that what was supposed to be an excellent location has turned out to be an unfortunate one, and the present methods of receiving and handling the material make the operations too expensive for successful competition of the briquettes with raw fuel. As a result of these unfortunate conditions it is proposed to remove the plant to a site better adapted for the receiving, storage, and shipment of material. The officials of both the New Jersey Briquetting Company and Zwoyer Fuel Company are entirely satified with the experimental results, and are confident of making the enterprise a commercial success.

A description of the plant in Brooklyn has already been published,[2] and the following notes are partly abstracted therefrom and partly furnished by Mr. Virgil H. Hewes, treasurer of the Zwoyer Fuel Company.

Prior to the construction of the plant in Brooklyn, the Zwoyer Fuel Company had built a small experimental plant in Jersey City, N.Y., but while this was of sufficient capacity for this purpose, it was not large enough to be operated as a commercial undertaking, and was abandoned.

It may be stated here that after a considerable expenditure of time and money in experimenting with different kinds of binders, coal tar pitch was decided upon as best suited to the work, a decision which has been generally reached in the Eastern States, as asphaltic pitch has with a binder composed of 6.25 per cent. of rosin and been adopted in the far West, where that article is cheaply obtained. During the progress of the experimental work, about 200 tons of briquettes were made oil, 1.5 per cent. of flour and water, and from 6 to 10 per cent. of bituminous coal, the body of the briquette being anthracite dust. About 900 tons of briquettes were made, using from 5 to 7 per cent. of rosin and oil and 10 per cent. of bituminous coal; 400 tons were made with from 5 to 7 per cent. of wood pitch and 10 per cent. of bituminous coal, and 1,500 tons were made with from 6 to 7 per cent. of coal tar pitch alone. In applying the binder during the last three experiments an atomizer was used.

The plant in Brooklyn has a capacity of 10 tons per hour, and was built for the purposes of demonstration. During the winter and spring of 1905-6 about 3,000 tons of anthracite briquettes were made and sold. The price received was $5 per ton of 2,000 pounds at the plant, $5.50 per ton delivered, and $6.60 per ton in bags of 100 pounds each. These prices were $0.50 below the prices of the domestic sizes of anthracite.

A plan of the building,[3] which is nearly triangular in outline, is shown in Fig. 1, which gives also the general arrangement of the machinery.

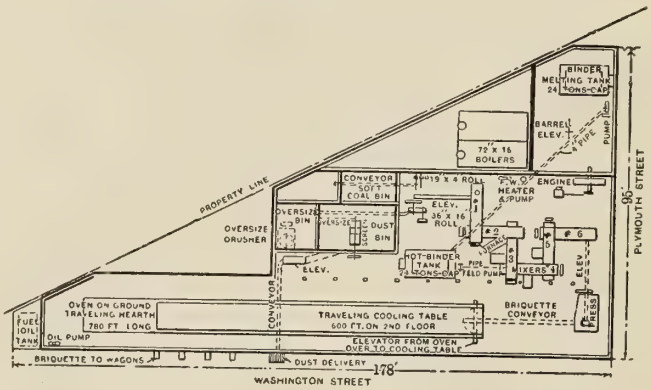

Fig 1—Plant of N. J. Briquetting Co., Brooklyn, N.Y.

The anthracite dust is received on Washington street at the end of a screw conveyor, which carries it to the foot of an elevator, where it is lifted to the top of the plant and is then spouted to a screen located over the dust bin. The coarser material is spouted either to the boiler room or to an over size bin in the rear of the dust bin, and from here fed into a crusher and then passes to the foot of the dust elevator, where it is again carried to the screen. The dust is drawn from the dust bin by a conveyor driven from a variable speed countershaft, and is fed to the 16 inch by 36 inch roll crusher. It then passes to an elevator which carries it to the mixers. After passing through mixers Nos. 1 to 6 it is carried to the second floor, when it falls into the press hopper.

From the press the briquettes are carried by a belt conveyor to the baking oven (when smokeless briquettes are wanted), and are then elevated to and distributed upon the cooling table, which is located on the second floor. After cooling, the briquettes are run into chutes and loaded into wagons for delivering, or are stored. In New York the briquettes sold readily when not baked.

On one side of the dust bin a soft coal bin was built from which soft coal was fed into a 19 inch by 4 inch roll crusher and passed to the same elevator which carries the dust to the mixers. Development has shown that it is not necessary to use the soft coal with anthra-

[1]United States Geological Survey Bulletins Nos. 261 and 290, and Professional Paper No. 48.

[2]*Iron Age,* vol. lxxvii., pp. 1330 to 1333 (1906).

[3]*Iron Age,* vol. lxxvii., p. 1330 (1906).

cite dust. However, this bin is used when experimental runs are made requiring the mixing of different materials with the dust.

The Binder.—Coal tar pitch, used as a binder, is received on the Plymouth street side of the building. It is hoisted to the second floor by means of a barrel hoist, where the staves are removed and the pitch is thrown into the binder melting tank (the tank holding about 15 tons of pitch), and pumped by means of a rotary pump into the storage or hot binder tank, where it is kept heated.

The Mixers.—Fig. 2 shows a plan and elevation with the relative position of the connecting mixers and heat flues, and Fig. 3 shows a typical section of a mixer unit. The number of units necessary in a mixer depends upon the material to be briquetted and the condition in which it is received. At this plant six were used, and have proved well adapted to the handling of coal, hard and soft, wet or dry, coke breeze and even iron concentrates.

The dust enters No. 1 mixer at *C*, Fig. 2, and is carried through mixers Nos. 1 to 6 in the direction indicated by the arrows to a point, *O*, mixer No. 6, and then by conveyor to the press. In passing through mixers Nos. 1 and 2 the dust is heated by the furnaces, F_2 and F_3,

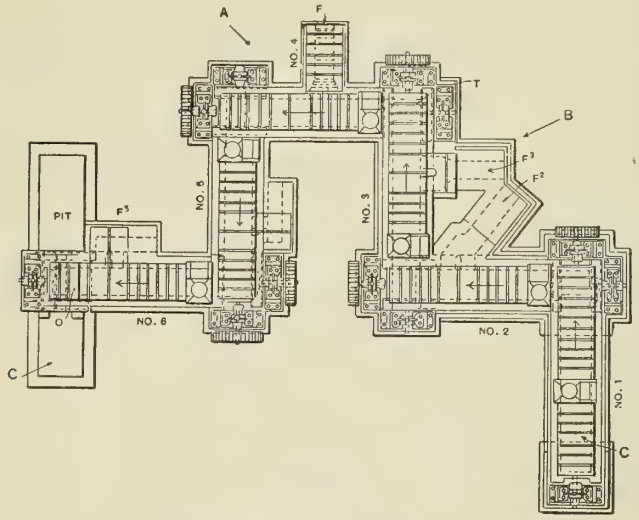

Fig. 2—Plan of the Mixers.

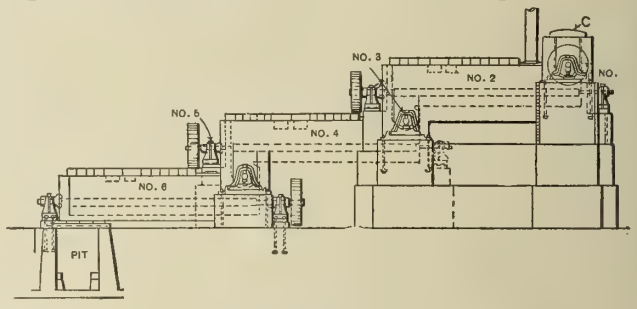
to drive off all the moisture. The coal tar pitch, being previously heated, is pumped from the storage tank by a small rotary pump driven from a variable speed countershaft, which regulates the percentage of pitch used.



The pitch is delivered to the mixer No. 3 at the point, *T*, Fig. 2, where it is atomized by means of a steam jet.

The above apparatus and process are patented.

The Press.—The roll type of press, shown in Fig. 4, is used, the rolls being built up of discs which are milled to form the pockets and are then assembled and bolted together on the shaft. This method, as well as the design of the briquettes, is patented. Two sizes of briquettes are made, 1 7-8 inch by 1 7-8 inch by 1 1-4 inch and 2 1-8 inch by 2 1-8 inch by 1 3-8 inch. The briquettes are square "pillow" or "pin cushion" shape. The smaller ones weigh 2 ounces and the larger 3.3 ounces.

Cooling Table.—The cooling table consists of three endless belts composed of steel plates carried at their ends by sprocket chains, the belts being placed one over the other and carrying the briquettes back and forth six times over a distance of 84 feet, making a total travel of 504 feet. The briquettes are then run into bins or loaded into wagons.

Staten Island Plant.—The Briquette Coal Company, J. P. Egbert, manager, No. 2 Stone street, New York, N.Y., has just completed the construction of a briquetting plant at Stapleton, on Staten Island. This plant is constructed for the purpose of using anthracite dust with coal tar pitch as the basis of the binding material. The anthracite dust is used as delivered. The plant does not possess any novelties in its design, except that there

No. 2—Vertical Section of Mixers.

are two presses of radically different types. One of these is of German manufacture, built at the works of Schüchtermann & Kremer, of Dortmund. This press is of the plunger type, in which the manner of feed, compression and ejection is similar to the Johnson (English) machine used at the United States Geological Survey testing plant at St. Louis, except that the disc containing the compressing moulds is set and revolves horizontally instead of vertically. The briquette is parallelopiped in shape with the end edges rounded. Its dimensions are 4.75 by 2.25 by 2.5 inches. Each briquette weighs about 1.5 pounds and has a specific gravity of about 1.24.

The second press is what is generally classed as the Belgian type, similar to the one described as the "American" machine used at the United States Geological Survey testing plant. This particular machine was made at the works of H. Stevens, at Charleroi, Belgium. The product is of the eggette pattern, which is more desirable for domestic use than the larger briquette. The eggettes weigh about 5 ounces, and have a specific gravity of 1.37. The manager of the company, Mr. Egbert, extended to me every courtesy possible, but unfortunately was not able to furnish any complete drawings or other illustrations, the plant having been constructed without them. The total capacity of this plant with both presses in operation is 120 tons of briquettes per day of

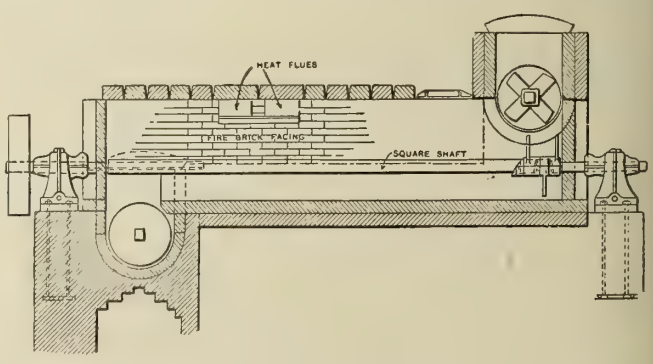


Fig. 3—Section of a Typical Mixer.

10 hours. The German machine will turn out 4.5 tons, and the Belgian machine 7.5 tons per hour.

South Brooklyn Plant.—Another plant, which has just been completed as this report is written, is that of the National Fuel Briquette Machinery Company, of New York, N.Y. This plant is located at the foot of Court and Smith streets, Brooklyn, and close to the Gowanus

canal, by which the materials to be used can be brought in barges and discharged at a minimum of expense. While intended to be operated upon a commercial basis, it may be considered rather as a demonstrating plant. It is intended for the use of anthracite dust with coal tar pitch as a binder. The press is of the Belgian type, producing eggettes or "bouletes," somewhat smaller than an ordinary hen's egg, and made exclusively for domestic use. The machinery used in this plant was patented in this country[4] by Mr. Robert Devillers, with whom I visited the plant, and to whom acknowledgments are made for courtesies extended. The eggettes produced by this plant are much smaller than those ordinarily made, weighing only about 1.5 ounces each, and having a specific gravity of 1.3.

North American Coal Briquette Company.—The company, with office at 177 Broadway, New York, N.Y., has been incorporated for the purpose of exploiting the Forst briquetting process, which comprises chiefly the material to be used as a binder, part of which, though kept secret, consists principally of coal tar pitch. The merit claimed for the secret ingredients of the binder is a great economy in the quantity of binder used for the manufacture of superior briquettes. The company has negotiated for the purchase of a Duprey (French)

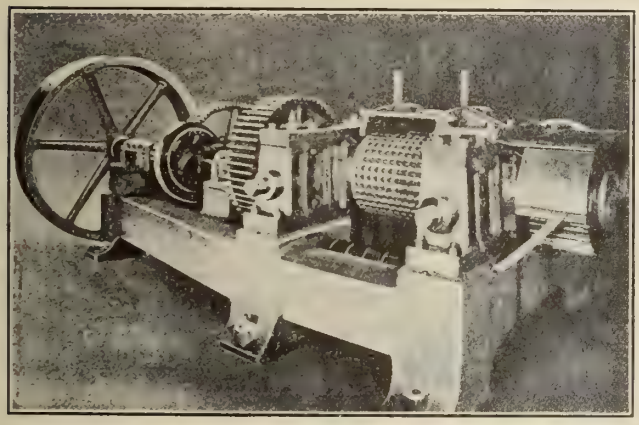

Fig. 4—Briquetting Press of the N. J. Briquetting Co.

machine, and has sent 10 tons of anthracite coal and one ton of binder to Paris for the purpose of demonstratting the claims made for the process controlled by the company.

The Mashek Briquetting Process.—The briquetting machine designed by Mr. G. J. Mashek (now with the Traylor Engineering Company, New York, N.Y.) has been described in detail by him.[5] The process was designed for the purpose of overcoming the objections to the use of briquetting machinery which had developed, principally through the failure of certain foreign-made machines to meet the requirements of the American trade. When starting on the development of his plans, in 1903, the general type of machinery in use in Europe was that making the large rectangular briquettes, weighing from 7 to 20 pounds each, and these proved unsuitable to American use. In designing his press Mr. Mashek adopted the Belgian idea of moulds contained in the peripheries of two tangential wheels, but instead of the eggette pattern, developed one which minimizes the blank spaces between the moulds and produces a briquette of pillow or pin cushion shape.

[4]U. S. Patent No. 799,149, Sept. 12, 1905.

[5]*Iron Age,* vol. lxxvii., pp. 1330 to 1333 (1906).

A view of the Mashek press, Fig. 5, shows the moulds on the periphery of the cylinders, and Fig. 6 is another view of the press.

The Traylor Engineering Company has recently built for Mr. E. B. Arnold a Mashek press, which has been installed at the foot of West 47th street, New York,

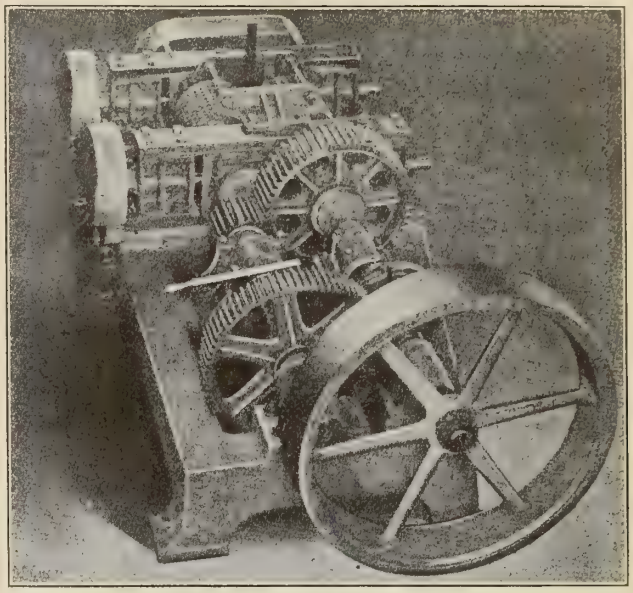

Fig. 5—Mashek Press—Moulds on Periphery of Cylinders.

N.Y. The building in which this is located was designed and erected for, and originally equipped with, a different type of machinery, but the briquettes made proved to be of a shape and character unsuited to the trade, and the cost of manufacture was also too high to enable the briquettes to compete with natural coal. When it was decided to substitute a Mashek press for the old one, it was also deemed advisable to use the same building, which is a substantial one, and also, as far as possible, the old machinery (such as elevators, shafting, power plant, etc.), which was practically new and in good order, but which did not permit of the most desirable arrangement.

The new press installed has a capacity of about 14 tons per hour of 2 ounce briquettes, but on account of

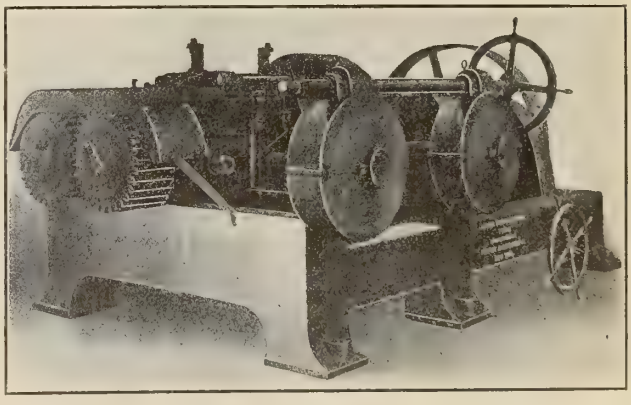

Fig. 6—Mashek Press Complete.

using so much of the old equipment it is impossible to handle sufficient material to keep the machinery running at its full capacity, and it is now operated at the rate of about 10 tons per hour. The cost of labor, fixed charges and other expenses being the same, the cost of production is slightly higher per ton of briquettes than would

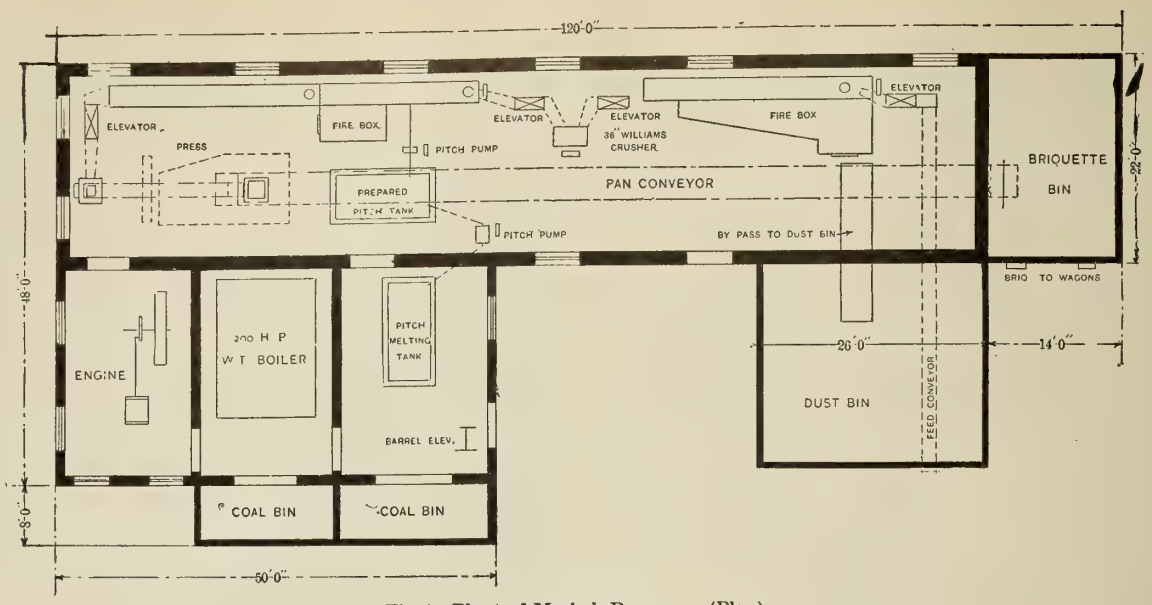

Fig. 7—Plant of Maskeh Process——(Plan).

have been the case if the plant was operated up to its maximum capacity. The size of the briquettes to be made has been determined by putting them on the market and selling them for domestic purposes, starting with 1 ounce briquettes and running up to 3 ounce. It was found that the majority of users preferred a 2 ounce size, which corresponds with the stove coal size of anthracite. The weight, of course, will vary with the nature of the dust from which the briquette is made, and it has been found that in using coke breeze a 2.5 briquette is most desirable, and about a 3 ounce if made of soft coal and lignite. The press is so designed that a change of the mould shells can be made in about 2 hours.

The plan and elevation of the Arnold plant are given in Figs. 7 and 8. The arrangement of the machinery is shown in Fig. 8. The anthracite dust is elevated to the dust bin, from which it is drawn by a feed conveyor so arranged that the feed is constant and can be regulated as desired. This conveyor discharges into a chain elevator, which in turn discharges into a battery of five 18 inch rotary driers and heaters. These are super-imposed one above the other and all bricked in. The material is conveyed through these driers by means of screw mixers until it passes into the following elevator.

On the side of these driers is constructed a furnace, the products of combustion from which are distributed into the driers through openings into the different units, so that no unit gets heat sufficient either to char the dust or to burn out the ironwork of the paddle conveyor. An exhaust fan draws off the products of combustion and the moisture. The temperature of the discharge gases and moisture from the drier rarely exceeds 212 degrees F. After the material passes out of the drier into the elevator it is elevated and dropped into a 36 inch Williams pulverizer, where the larger pieces are crushed, so that everything passes through about a 12 mesh screen. From the pulverized the material is again elevated to another series of mixers and coolers similar in construction to the driers. The anthracite dust at this point has a temperature of about 300 degrees F. The coal tar pitch is here introduced by means of a pitch pump so arranged as to deliver a definite quantity of pitch, as desired. Alongside of this last battery of mixers is a small furnace which heats the two upper mixers, maintaining an even temperature of the mixture and not allowing it to stiffen or set. From the last mixer the material drops to an elevator which takes it up to the second floor and discharges it on to an 18 inch belt con-

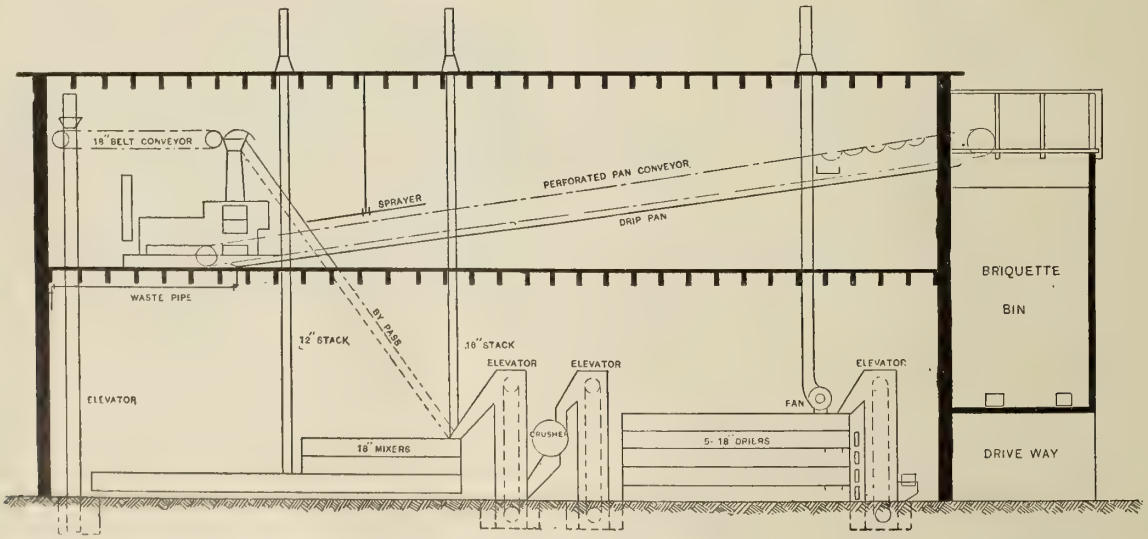

Fig. 8—Plant of Mashek Process (Elevation).

veyor, which delivers the material over the press and into the hopper. The press is run continually, discharging the briquettes into a perforated pan conveyor, which conveys them to the briquette bin. The briquettes while in this conveyor are subjected to a heavy spray of water in order to cool and clean them.

The coal tar pitch used in this plant is of the ordinary roofing hardness; it is delivered by lighter on an adjacent dock and carted to the pitch melting house, where it is melted in a tank 6 feet wide, 12 feet long, and 8 feet deep.

This pitch melting tank will hold about 22 tons of pitch, which requires in the neighborhood of 20 hours to melt. After the pitch is melted and brought up to the proper temperature for use it is drawn off by means of a large pitch pump into the "prepared pitch tank," from which it is pumped into the mixers.

This plant requires about 125 h.p. to turn out 10 tons per hour. It has been in operation about two months and is said to be giving excellent results. The product is used almost entirely for domestic purposes, and commands the same price as the best grade of prepared anthracite coal in the New York market. A large portion of the output is put up in paper bags and handled by grocers and small coal dealers the same as charcoal or crushed coke. The bag trade caters to the poor people who do not buy in large quantities, and is a considerably cleaner method of distributing the product than that formerly used.

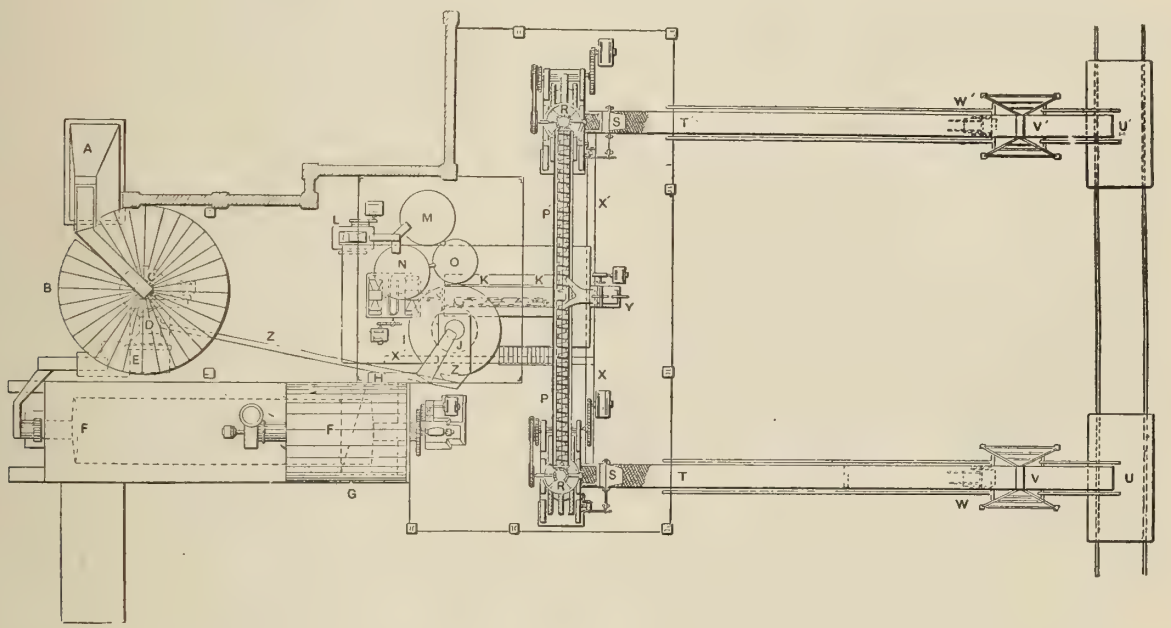

Fig. 9—Plant of United Gas and Improvement Co., Philadelphia (Plan)

Out of the briquette bin the briquettes are handled the same as ordinary coal, and experience has shown in this and other plants that abrasion or breakage averages about 3 per cent., which is slightly less than with ordinary prepared coal.

The cost of manufacture is as follows:—

Pitch—

Using 6 per cent. of pitch at $10 per ton	$0.60
Deducting increased weight of product due to 6 per cent. of pitch	0.30
Net cost of pitch	$0.30

Fuel—

For boiler, broken coal and screenings, broken briquettes, 4 tons per day of 10 hours, at $2.50 per ton	$10.00
Per ton of briquettes	0.10
For heaters, driers and pitch melting, 3 tons at $2.50 per ton=per ton of briquettes	0.075

Labor—

	Per day.
1 foreman	$5.00
2 pitch melters	3.50
1 dust bin man	1.75
1 engineer	3.50
1 man on second floor	1.75
1 man on ground floor	1.75
1 night watchman	1.75
1 oiler	1.75
	$20.75
Per ton of briquettes	0.21

Miscellaneous—

Wear and tear, per ton of briquettes	0.21
Lubricating oil, per ton of briquettes	0.01
Insurance	0.005
Interest on capital invested, $40,000, at 6 per cent.	0.10
Office expense, telephone, stenographer and stationery, $2,000 per annum	0.09
	$0.99
Anthracite dust at $1.40 per long ton=per ton of briquettes	1.25
Total cost of briquetting	$2.24
Re-briquetting 3 per cent. of breakage and abrasion, charging it back to plant as dust, per ton of briquettes	0.06
Net cost per ton of briquettes	$2.30
Wholesale selling price in bin	4.80
Net profit per short ton	$2.50

PENNSYLVANIA.

It might be supposed that the briquetting industry would have its greatest development in or near the anthracite region of Pennsylvania, where a plentiful supply of raw material is available in the great culm banks created through the many years of mining, and in the still large amount of fine coal produced at the breakers for which no profitable market has yet been found. Up to the present time, however, there are but two briquetting plants in operation in the State, one at Point Breeze, in the City of Philadelphia, and the other at Dickson, a few miles from Scranton. Both of these were put in operation in 1906. The plant at Dickson is in the immediate vicinity of the mine of that name, operated by the Delaware, Lackawanna & Western Railroad Company, and uses the fine coal or screenings, below marketable sizes, coming from the washery operated in connection with the mine. The owner of this plant, the Scranton Anthracite Briquette Company, withholds information relative to the details of its operations. I have been informed, however, by one of the officials of the company that the base of the binding material used is coal tar pitch, and that the plant is producing at the present time—April, 1907—from 300 to 325 long tons of briquettes per day. It is the intention to double this output by running the plant night and day. The briquettes are of the oval or eggette shape, the press being of the Belgian type, and similar to the "American" machine used at the testing plant of the United States Geological Survey at St. Louis during the exposition period.[6] The entire product is taken by the Delaware, Lackawanna & Western Railroad Company for use, principally, on its locomotives.

The other plant, at Point Breeze, is owned and operated by the United Gas Improvement Company, and was constructed for the purpose of utilizing the coke breeze produced at the gas houses of the company, and in this case, as in the case of the plant at Dickson, the product is not placed upon the market but is used by the company in its retorts for the manufacture of water gas. I am indebted to Mr. W. H. Gartley, Engineer of Works of the United Gas Improvement Company, for the following detailed description of the plant, and for the accompanying illustrations, Figs. 9 and 10.

It has been found advantageous to use a mixture of anthracite culm and coke breeze, with from 5 to 7 per cent. of coal tar pitch as a binder. The proportions of culm and coke used are variable, according to the quantity of material on hand. At the time I visited the plant—November, 1906—three parts of culm to two parts of coke were being used. The press is of the Belgian type, producing eggettes about the size of a goose egg. The rated capacity of the plant is 10 tons of eggettes per hour. It has been in operation regularly, producing 90 tons per 9 hour day, except when it has been shut down for repairs and changes. Figs. 8 and 9 show the arrangement of the plant.

The breeze or screenings from the coke screen (not shown on the diagram) of the coal gas plant fall into a pocket or hopper, *A*. Into this pocket is also dumped the culm. The contents are raised by an elevator into the storage tank, *B*, discharging through the funnel-shaped bottom on to the automatic feed table, *C*, by which a measured stream of the material is continuously poured, part into the crusher, *D*, and part directly into the hopper, *E*, below the crusher. The material is then elevated and discharged into the drier, *F*, *F'*. The dried material, together with the dust from the dust chamber, *G*, *G'*, of the drier is discharged into the hopper, *H*, *H'*,

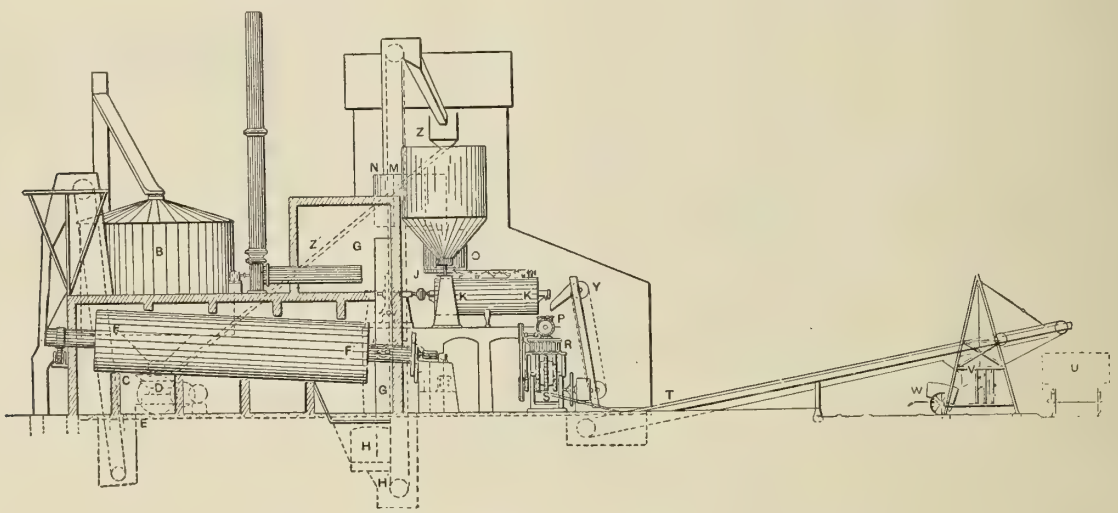

Fig. 10—Plant of United Gas and Improvement Co. (Elevation).

elevated and discharged through a shaking screen into the storage tank, *I*, located above the mixer. All material not fine enough to pass through the screen, *Z*, is returned by a spout, *Z'*, to the crusher, *D*. The dried material in tank, *I*, is discharged through the funnel-shaped bottom on to the automatic feed table, *J*, by which a measured stream is continuously poured into the mixer, *K*, *K'*. Into the feed end, *K*, of the mixer is also poured a continuous stream of liquid pitch through a positive measuring faucet (not shown), driven from the driving mechanism of the mixer through a variable speed device (not shown). The pitch its brought into the building as broken from the pitch bays of the tar distillery, fed into the pitch cracker, *L*, elevated and discharged into the large steam heated pitch storage tanks, *M*. *N*, where it is melted. From these tanks the melted pitch is drawn, as required, into the smaller steam heated tank, *O*, to which the faucet, previously mentioned, is attached.

The warm, dry, and continuously measured crushed breeze and culm, together with the melted and continuously measured pitch, are thoroughly mixed and kneaded in the steam jacketed mixer, *K*, *K'*. The mixed mass is discharged from the mixer, divided (devices not

[6]United States Geological Survey Bulletin No. 261, and Professional Paper No. 48.

shown) into two streams and carried by two mixing conveyors, *P, P'*, allowing time for cooling and setting, into the feed pans of the two presses, *R, R'*, purchased in France. From the feed pans the material is fed to the presses, which press out the eggettes and discharge them on to the shaking screens, *S, S'*, below, which screen them from the waste and fines. They are then discharged on to the woven wire belt conveyor, *T, T'*, giving the eggettes time to cool and set, and conveyed either to the cars, *U, U'* or to the hoppers, *V, V'*, from which the buggies, *W, W'* for the generator house are filled.

The waste and fines from the shaking screens, *S, S'*, under the presses, are conveyed by conveyors, *X X'*, to the hopper, *H'*, at the discharge of the drier.

Screenings from the eggettes taken from the storage piles are returned by an elevator, *Y*, to the discharge of the mixer and assist in the cooling of the heated mixture.

(To be continued.)

THE AUSTRIAN IRON INDUSTRY DURING THE LAST 25 YEARS*

By Wilhelm Kestranek, General Manager of the PragerEisen-Industrie-Gesellschaft and of the Böhmischen-Montan-Gesellschaft.

At the meeting of the Iron and Steel Institute, held in this city twenty-five years ago, the celebrated Professor Peter von Tunner described the iron industry of Styria and of Carinthia as representing the iron industry of the whole of Austria. He warned the members present at the meeting who were prepared, like you are now, to visit the centres of production of the Austrian iron industry, that they might be disappointed in their expectations, and his statements principally dealt with the reasons why the Austrian iron industry generally, and that of Styria and Carinthia specially, had remained stationary, and had been surpassed by that of England, of Germany, and even of France and Belgium.

He referred to the proud past of the ancient Alpine iron industry, and made due mention of the legend that the nails with which Christ was crucified were made of Noric iron obtained by the Romans from the Alpine districts. From the description of Peter von Tunner, the Austrian iron industry appeared to play the role of an impoverished nobleman, who, whilst regarding the future with apprehension, recalls the past with pride. The iron industry of the monarchy has, however, not resigned itself to this role. Indeed it has spared no endeavor to maintain its position, and I believe that, viewing the development of the home iron industry during the last twenty-five years, I am in a position to state that these endeavors have been successful, even if the industry, for reasons which will be considered later, has not reached that degree of development which the leading iron and steel producing countries have reached during the last twenty-five years.

In order to ascertain what progress has been made it will be necessary to compare the present production of pig iron with that of twenty-five years ago. In the year 1882 the world's production of pig iron, which in the year 1807 had been 760,000 metric tons, had reached about 21,000,000 metric tons. To this total the most important producing countries contributed the following proportions:—

	Metric tons.
Great Britain	about 8,600,000
United States	about 4,600,000
Germany, including Luxenburg	about 3,400,000
France	about 2,000,000
Belgium	about 700,000
Austria-Hungary	about 600,000
Russia	about 400,000
Sweden	about 400,000
Spain	about 100,000

The world's annual production of pig iron is at the present time about 61,500,000 metric tons; and the various iron-making countries now stand in the following order:—

	Metric tons.
United States, with about	27,000,000
Germany, including Luxemburg, with about	12,800,000
Great Britain, with about	10,100,000
France, with about	3,400,000
Russia, with about	2,800,000
Austria-Hungary, with about	1,900,000
Belgium, with about	1,500,000
Sweden, with about	600,000
Spain, with about	400,000

From the above it will be seen that the iron industry of the monarchy, which twenty-five years previously held the sixth position among iron-producing countries, still occupies the same position, while in the meantime other countries have undergone many changes. For instance, Great Britain has had to cede the leading position to the United States, and during the last few years has also been surpassed by Germany. France, where the conditions of the iron industry resemble in many respects those of this country, has been able to maintain its place in the fourth position. The fifth place, which is now occupied by Russia, was taken from Belgium, whose production of iron formerly exceeded that of Austria-Hungary.

The Austrian iron industry contributes the principal share to this increase in the production of pig iron in Austria-Hungary, and the increase approaches to that of Great Britain during the same period. Of the 612,000 metric tons of pig iron produced in 1882 in Austria-Hungary, 436,000 tons were produced in Austria and 176,000 tons in Hungary. To the present total production of 1,910,000 metric tons, Austria contributes 1,434,000 metric tons, Hungary 450,000, and Bosnia 46,000.

It is interesting to note that during the last twenty-five years the world's production of pig iron increased in value from about 17000 million Austrian crowns to about 4800 million crowns, while the value of the production of gold rose from 510 million crowns to 1950 million crowns. The value of the pig iron produced represents at the present time about two and a half times the value of the output of gold.

*Paper read before the Iron and Steel Institute, September, 1907.

If Peter von Tunner, twenty-five years ago, rightly ascribed the advantages of the leading countries in the European iron industry as due to their abundance of mineral fuel, it may still be said that the progress of the Austrian iron industry would have been far greater if coke had been available in greater quantities.

The country, however, suffers from a scarcity of coking coal, and for this reason it has had to import coke from foreign countries, especially from Germany. In 1906 the production of coke in Austria was 1,700,000 metric tons, while for other countries the following returns are available:—

	Metric tons.
France (1906)	1,700,000
Russia (1906)	2,000,000
Belgium (1905)	2,200,000
Great Britain (1905)	18,300,000
Germany (1906)	20,300,000
United States (1905)	29,200,000

Austria-Hungary exports yearly about 300,000 metric tons and imports about 600,00 metric tons, so that the difference of 300,000 tons has to be obtained from abroad.

Austria-Hungary possesses several very rich deposits of iron ore, such, for instance, as the celebrated Styrian Ore Mountain. A more extensive smelting of the Austrian-Hungarian ores is hindered by the want of fuel, and for this reason Austria-Hungary at the present time is one of those countries which export iron ore.

The imports of iron ores amount yearly to 246,000 metric tons, and the quantity exported, to which Hungary contributes the largest share, amounts to 324,000 tons.

It can be taken as an axiom that the development of the iron industry of a country, in relation to the consumption, depends more on the richness of its fuel resources than on an abundance of iron ore. Thus it is seen that countries such as Sweden and Spain, which are rich in ore and poor in fuel, export the greater part of their output of ores to countries rich in fuel, and are, in proportion to their wealth in ore, only small producers of pige iron. Other countries, on the other hand, such as Great Britain, which depends to a large measure on the importation of iron ores, and Germany—which also has to import considerable quantities of ore—occupy a leading position. It is unnecessary to mention the happy United States, which rejoices in the possession of an abundance of ore and of coking coal, and for this reason naturally occupies the leading position.

The quantity and quality of the iron ores are as important a factor in commercial competition in the iron industry of a country as are the number and condition of the soldiers of an army; while the fuel resources are for the iron industry what the generalship and armament are for such an army. Under otherwise equal conditions the superiority in training and equipment of an army are more efficacious at the present time than mere weight of numbers. It therefore appears to me that the quality and quantity of fuel available are more decisive factors in the industrial development of the iron trade of a country than wealth of ores.

If I may further develop this comparison, it may be mentioned that the conditions of two combatants are also naturally influenced by other important circumstances, such as the existence of ramparts, or in other words, protective duties; further by the natural resources and financial wealth of the two competitors, which in the case under consideration is the demand of the home market. Finally, the fortune of ware depends on whether the forces are kept free from disease. Such diseases, mostly of a contagious character, are strikes, and the efforts of organizations to hinder production.

As an example, I believe that the development of the British iron trade would have been far more successful if the introduction of technical improvements had not been hindered by the action of trade organizations.

It must be specially remarked, with reference to the demand of the Austrian market, that there is great need of development, because large tracts of territory—not only in the mountainous Alpine districts, but also in the east of the Empire—are capable of a more intense productive activity.

It must be here mentioned that the yearly output in Austria of merchant iron is not more than 350,000 metric tons; 150,000 of girders, 70,000 of rails, and 65,000 of sheets.

The consumption of iron in any country obviously depends to a considerable extent on the population; and for this reason, in order to judge the figures given and particularly the amount of the production of pig iron of the several iron-producing countries, their populations are compared for the years 1882 and 1906:—

Population of Chief Iron-Producing Countries.

	1882.	1906.
United States	49,000,000	90,700,000
Germany	45,500,000	61,500,000
Great Britain	31,400,000	44,200,000
France	36,000,000	39,300,000
Russia	77,000,000	120,000,000
Austria-Hungary	42,700,000	49,100,000
Of this fell to		
Austria		27,300,000
Hungary		20,000,000
the Occupied Provinces		1,800,000
Belgium	5,900,000	7,300,000
Sweden		5,300,000
Spain		18,500,000

The yearly consumption in kilogrammes per head of the population, based on the production of pig iron, and also taking into consideration the export trade in machinery and in other iron ware for the various countries at the present time, may be taken as follows:—

	Kilogrammes.
United States	320
Great Britain	220
Belgium	160
Germany	145
France	65
Austria	50
Hungary	25
Russia	25

The measure of the industrial condition of a country depends less on the production of iron than on the production and consumption of fuel. The production of coal of the various countries for the year 1906 was as follows:—

		Metric tons.
United States		375,500,000
Germany		193,500,000
Including:		
Coal	137,100,000	
Brown coal	56,400,000	
Great Britain		255,000,000
France		34,300,000
Including:		
Coal	33,600,00	
Brown coal	700,000	
Russia		19,600,00
Austria		37,700,000
Including:		
Coal	13,500,000	
Brown coal	24,200,000	
Belgium		23,600,000

The yearly consumption of coal per head of the population in these various countries is given in kilogrammes in the following table:—

	Kilogrammes.
Great Britain	4680
United States	4050
Germany	3140
Belgium	2980
Austria	1370
France	1190

It may be remarked that the degree of general industrial activity of the countries named is proportional to the figures given for the consumption of coal, which agree, except for a few small differences, with the proportions given for the production of coal, calculated per head of the population. These figures therefore afford a measure of the economical conditions of the civilized countries mentioned.

With regard to the production of coal of Austria, it must be stated that the greater part of the output consists of brown coal, so that if the calorific value be taken into consideration, the production of coal of Austria can be approximately estimated as equal to that of France. The demand for coal in Austria-Hngary is not fully met by its own production, and at the present time about 7,500,000 metric tons of bituminous coal are imported, against an export of 8,1000,000 metric tons, of which, however, only about 900,000 metric tons are bituminous coal, and 7,200,000 metric tons are brown coal.

If not only the weight but also the calorific value be included in the calculation, the import exceeds the export in fuel value.

The prosperity of the Austrian iron industry is not only impaired by the want of mineral fuel, but also by the circumstance that it can only be brought to the principal producing works by costly methods of transport. The pig iron producing centres of Bohemia and Styria are situated in localities possessing rich supplies of iron ores, and have at their disposal, on the spot, extensive deposits of coal. They are, however, entirely without coking coal, and depend on the import of coke from the Mährisch-Ostrau, Prussian-Silesia, and Westphalian coal fields. The Ostrau pig iron producing centre, on the other hand, possesses an ample supply of coke, but has to obtain its ores chiefly from Hungary, which renders them expensive, owing to the high railway freight charges. The blast furnaces situated in the southern parts of the monarchy, like Bosnia, possess large deposits of ore, but mineral fuel is wanting. Throughout the whole of Austria there are no blast furnaces which have both ore and coke on the spot.

If, in spite of this want of mineral fuel, in spite of the circumstances conspiring to increase the cost of production, and that either the fuel or the ore can only be brought to the producing centres by costly routes, and in spite of the limited demand of an extensive portion of the Empire, the Austrian iron industry has been able during the last twenty-five years to keep pace relatively with the other iron-producing countries, this can be attributed to three reasons: firstly, to the sufficiency of the protective import duties, behind the wall of which a prosperous development of the iron industry has been possible; secondly, the association of the ironworks into a syndicate, whereby ruinous competition has been prevented; and thirdly, the concentration of the smaller works into larger units. By these two last mentioned means the adoption of more economical methods of working has been rendered possible.

The protective duties of several countries are given as follows, in order that the duties prevailing in Austria may be more clearly appreciated.

Duty Per Metric Ton in Crowns.

	United States.	Germany.	France.	Austria-Hungary.
Pig iron	19.4	11.7	14.3	15.0
Rough plates	54.4-108.8	58.5	71.4	90.0
Girders	54.4	29.3	47.6	70.0
Rails	38.1	29.3	57.1	60.0
Iron bars	65.3-87.0	29.3	47.6	60.0

Should any one feel astonished and filled with envy at the height of the duties protecting the Austrian iron industry, and at the high prices obtained in the country for iron manufactures, it must be remembered that a large share of the profit is absorbed by the State and other corporations, such as land, district, and Commune, in the form of taxes and rates.

As an illustration of this it may be instanced that the Prager Eisen-Industrie-Gesellschaft, together with the Böhmischen Montan-Gesellschaft, during the last eight years, a period contemporaneous with that of the application of the new taxes, paid to the State and to the other corporations mentioned 21,840,000 crowns, and to the shareholders 62,650,000 crowns, so that the former, which enjoy practically the position of preference shareholders without having had to provide any capital whateved, received more than one-fourth of the resulting profit, while on the other hand the real shareholders, who undertake the entire risk, received less than three-fourths. According to the peculiar construction of the rating law it has even happened that in one year the shareholders of the Prager Eisen-Industrie-Gesselschaft received in dividends 3,877,500 crowns, whilst the State and corporations received 4,116,107 crowns.

In this regard the Elysian fields must not be sought for in Austria, but are to be found in the United States, where the iron industry, working under the most favorable conditions both of production and protection by high duties, is so little liable to public taxation, that—according to authentic reports—a contractor, who in one year had obtained a net profit of 1,500,000 dollars, only had to pay 6,000 dollars in public taxes.

As a result of the import duties protecting the Austrian iron industry, Austria is completely closed to foreign iron; and thus we see that, whilst only twenty-five years ago a considerable proportion of the home consumption even for those manufactures in which high quality was imperative, had to be drawn from foreign countries, at the present time home products take their place.

Twenty-five years ago the inland railways purchased the greater part of the tires required, especially for passenger locomotives, in foreign countries; at present we find none but home manufactured tires in use. At that time in the workshops English tool steel was the most prized, but now it has been completely superseded by the highest qualities of steel made in Austrian steel works. Formerly the Austrian War Office purchased cannons, projectiles, and armour plates from the leading producers of foreign countries, and the warships of the monarchy were almost entirely built of foreign materials; at the present time home manufacturers of armour plates, of cannons, and of projectiles, whose products do not need to fear comparison with those of any other countries are available, and warships of the most modern construction, whose parts from keep to top-mast are manufactured in home workshops, navigate our seas.

Thus in the last twenty-five years Austria has made herself entirely independent of foreign countries, both as regards quantity and quality of the iron manufactures required in the country. The system of protective duties has therefore completely fulfilled its principal object.

During this period, as already mentioned, the Austrian iron industry has combined to form a syndicate, which embraces nearly all the branches of the iron trade. By this means it has been possible to utilize the ful ladvantages of protection, not only to protect the home market from foreign invasion, but also to obtain an opportunity in providing a share, if only a modest one, for the markets of the world.

How greatly the conditions in this respect have changed during the last twenty-five years can be best ascertained from the fact that in the year 1895 the imports of iron and of manufactures amounted to 230,000 metric tons, against an export of scarcely 40,000 metric tons, so that the imports exceeded the exports by over 190,000 metric tons. In the year 1906, 120,000 metric tons of iron and ironware were imported, against 240,000 metric tons exported, so that the difference in favor of the export was 120,000 metric tons.

In 1895, 174,000 metric tons of pig iron were imported, and only 9,000 metric tons were exported. Up to the year 1906 the import of pig iron declined to 62,000 metric tons, and the export increased to no less than 74,000 metric tons.

As already stated, the Austrian iron industry during the last ten years has welded together the smaller scattered ironworks into larger units in many cases, whereby, in combination with the division of production by the syndicate, the possibility of adopting more economical methods of working has been attained.

It is exactly twenty-five years ago that, to take an example, the Oesterreichische Alpine Montangesellschaft was formed from nine concerned, which then comprised thirty-three producing workshops, and produced yearly 165,000 metric tons of pig or and 620,000 metric tons of coal, and employed 17,500 men. The same concern produces at the present time 470,000 metric tons of pig iron and 1,200,000 metric tons of coal, and only employs 13,-400 men.

To what extent the conditions in Austria has rendered imperative the division of labor, made possible by the organization of the syndicate, and the concentration of the producing works, is best seen from the fact that the average annual output of girders in Austria during the last ten years was only 95,000 metric tons, and at the present time is not higher than 150,000 metric tons, in the production of which five works participate, or that the demand of the Austrian railways for rails amounted during the last ten years to an annual average of not more than 80,000 metric tons, and at the present time this quantity is not exceeded. The production of this small quantity is also divided amongst five ironworks.

Theorists express the opinion that protective duties and trade syndicates hamper technical progress, because they put into the pockets of those interested abundant profits without any trouble. Opposed to this view, the Austrian iron industry can with pride point out convincingly that such a theory is devoid of foundation, because they are always endeavoring to improve their works technically. The Austrian ironworks have utilized all the modern methods for economical working, although they have been naturally limited, because their plant and appliances require to be fitted to a great variety of manufactures, and must be designed to suit the proportionately small consumption of the country.

The Austrian iron industry has therefore to avoid mere slavish imitation of the gigantic works in the United States, and has modified methods to suit the given conditions.

It is quite a different thing to erect a rail rolling mill, which has a yearly production of 800,000 metric tons, as is done in the United States, and, as is the case in this country, to arrange that five ironworks shall share between them one-tenth of this production, and at the same time be forced to produce rails, girders, sleepers, and similar material in one and the same mill. Though the Austrian ironworks endeavor to render serviceable all appliances which are intended to effect a saving of manual labor, yet they are not in many cases urged so far in this direction as the American works, which are guided by the scarcity of workers and the high rate of wages. Whilst in that country the demand for labor is met by immigration, a mighty living stream flows from our monarchy, especially from the other half, Hungary, where the emigration is facilitated, by the Government; and it is greatly to be regretted that our Empire stands at the head of those countries which provide the rest of the world with workers. During the year ending with the 30th of June, 1906, the number of emigrants amounted to 265,000, of whom 153,000 came from Hungary. During the month of March of this year alone 43,000 persons emigrated from Austria-Hungary to the United States, of whom 27,400 were Hungarians. With these figures our monarchy even surpasses Italy, which up to recent times had furnished the largest contingent of emigrants.

If then you consider the various centres of production of the Austrian iron industry, you must, in forming opinions as to whether the plant and the improvements adopted represent the most modern requirements or not, continually keep before you the conditions depicted, and especially consider that the consumption of iron is very limited, that a production of large quantities, attainable by the most intense specialization, as is to be found in the United States, in Great Britain, and Germany, appears to be out of the question, and that the Austrian ironworks are obliged to divide their proportionately small productions into a considerable number of different manufactures.

Taking into consideration all the local conditions, the Austrian ironworks believe that they have done the best possible to them with regard to technical progress, and await your judgments with tranquility.

You will find that, where the conditions exist for a larger production of pig iron, at the Oesterreischische Alpinen Montangesellschaft, and also in Witkowitz, blast furnaces, with a daily production up to 450 tons, equipped with all the most modern appliances, such as automatic charging apparatus. You will find the most complete utilization of blast furnace gases, as, for example, in the Königshof ironworks of the Böhmischen Montan-Gesellschaft, where blast furnace gas engines of more than 6,000 horse-power are installed, by which not only the blowing engines but also the rolling mill for rolling sheets (the most important in the monarchy) are wholly driven. You will be able to observe the greatest possible utilization of other by-products of the blast furnaces and steel works; you will find the slags rich in phosphorus in Kladno and Königshof converted into artificial manure; at Witkowitz, Kladno, and Königshof the blast furnace slags are manufactured into slag bricks and slag cement, and the slag cement works at Königshof are the largest of the kind on the continent.

You will find everywhere the most extensive application of electricity, mostly in conjunction with blast furnace gas engines, and also coke ove ngas engines for the generation of power, and, as an example, in Witkowitz a plant of this description of 5,700 horse-power exists.

It should here be noted that at the Austrian blast furnaces which yield 790,000 cubic metres of gas per hour, 263,000 cubic metres are used for blast heating, so that 527,000 cubic metres are available. Of this quantity, at the present time 358,000 cubic metres, or 68 per cent., are utilized for boiler heating, and 34,000 cubic metres, or 6.5 per cent., representing 12,000 horse-power, in gas engines, whilst the remainder of the gas is used partly for ore roasting or in drying kilns, and partly drawn off unutilized. The Böhmische Montan-Gesellschaft, which at present is utilizing blast furnace waste gases on the most extensive scale, utilizes 23 per cent. of the available gas in gas engines.

In the Austrian coke works, the coke ovens yield 86,000 cubic metres of gas per hour, of which quantity the coke ovens themselves absorb 62,000 cubic metres, so that 24,000 cubic metres are available. Of this quantity 5,700 cubic metres, or 24 per cent., are utilized in gas engines, whilst the remainder is used for boiler heating.

The most complete application of electricity to the driving of rolling mills will be shown to you in Teschen, where, as is well-known, not only the finishing, intermediate and roughing trains, but also the reversing rolling mills, are driven by electric motors. It must be recorded that as early as 1897 in Servola, Triests, the Krainische Industrie-Gesellschaft at their blast furnace plant installed an electric ship loading crane, on the American Brown system, to serve a blast furnace with daily output of 250 tons.

It will also be brought to your notice that the Austrian steel works engaged in the manufacture of alloy steels of great value, especially tool steel, have also lately adopted the new electric processes.

Thus we find that the Poldihütte have adopted the Kjellin process, the firm Gebrüder Bohler & Company are introducing the Ch. A. Keller electric arc process, and the new Styrian cast steel works of Danner & Company employ the Héroult process; the Kärntnerische Eisen- und Stahlwerks-Gesellschaft have also decided to adopt the Héroult process at their works in Ferlach.

You will find many other things which will repay your attention, and will show you that the Austrian producers of iron have spared no trouble to maintain the position of their works at a high degree of technical equipment. It must, however, be repeatedly remarked that the Austrian ironworks can never neglect existing conditions, and I must ask you when judging our plants to continually bear in mind the special conditions, which are that the Austrian iron industry does not possess sufficient coke, that it must be brought from great distances, at a great expense, to where the ore is found, or the reverse, that the ore must be transported in a similar costly manner to the coke ovens, and that the output which the home market requires is proportionately small, so that manufacture in bulk and a specialization of the rolling mill equipment appears to be entirely out of the question.

The lack of specialization in many cases prevents an extreme supersession of manual labor and the application of arrangements to attain this object, which appears to be less necessary in Austria than in those countries where wages are high and where the necessary labor is wanting.

If, in the description given above of the Austrian iron industry of twenty-five years ago, you may seem to detect some note of quiet resignation, so I believe that industry looks forward to further future extentions with hopeful confidence, the more because I believe in the prediction, which the past-president of the Iron and Steel Institute, Mr. R. A. Hadfield, made in his brilliant address in the year 1905-1906, that within a measurable time the world's production of iron, owing to the lack of iron ore, will be unable to satisfy the demand. Mr. Hadfield gives the amount of iron ore in sight at 10,000,000,000 tons, a supply which, at the rate of consumption observed during the last twenty-five years, would be exhausted in about forty years. There is no danger that in forty years the world will suddenly be without iron, for the discovery may confidently be expected of many, at present unknown, deposits of iron ore in the undeveloped districts of Eastern Asia and Africa; it is, however, certain that the increase in production of pig iron must attain a limit within a measurable distance of time.

These conditions may similarly be experinced in Austria at a not very distant date. If you will allow again twenty-five years to elapse before your next visit, which I am far from wishing, then many important deposits of ore in Austria and Hungary will be exhausted, for instance those Bohemian deposits of ore which the blast furnaces of the district charge together with ores rich in phosphorus, so that they will be obliged to fall back to other existing deposits, which, owing to their low percentage of iron and high percentage of silicon, cannot at the present time be smelted with economy. In the south of the monarchy, in Bosnia, there are still undisturbed deposits of ore, and the Styrian mountain of ore certainly represents an almost inexhaustible source of supply, but all these auxiliary sources can only serve to keep the Austrian iron industry at a certain level, without rendering any considerable rate of increase possible.

On the other hand, the consumption of iron increases progressively, so that I consider that the time is not very remote when the Austrian iron industry must renounce its share of the supply of the world's market, while afterwards—according to my opinion after scarcely twenty-five years—foreign iron will be imported to satisfy the demands of the home market.

If the producers of iron of the rest of the world in the coming, as in the past quarter of a century, should so considerably enlarge their homes and build up palaces, Austrian ironmasters must moderate their pretensions and keep their dwellings within modest dimensions. They will, however, at all times endeavor to keep them swept and garnished, so that all who dwell in palaces can nevertheless at all times enter them with pleasure, and they themselves will take no less pride in their homes than the dwellers in palaces.

A very minute amount of cobalt as chloride or sulphate, when added to a large excess of boiling strong solution of potassium hydrate or sodium hydrate gives a blue color which is destroyed by dilution. Nickel salts in larger proportion give a blue of different quality, which becomes reddish when heated.

The alumina contaminating the silica left by the ordinary evaporating to dryness with hydrochloric acid, can be rendered soluble in hot hydrochloric acid by igniting the precipitate for two or three minutes. If the ignition is too intense or too prolonged the alumina becomes again insoluble.

A NEW BLUE-BLACK IRON PAINT AS A PROTECTIVE COVERING*

By F. J. R. Carulla (Derby.)

In the preparation of iron and steel rods for wire drawing and galvanizing, as also in the preparation of plants for tinning, etc., the iron is kept for a time in a bath of acid to remove the scale. The acid used may be sulphuric acid, when a solution of sulphate of iron ("copperas") is produced; or hydrochloric acid may be employed, when a solution of chloride of iron is obtained.

A number of methods have been devised to utilize these solutions, and it is the object of this paper to bring before you the one which appears to be the most valuable when chloride liquors have to be dealt with.

The acids named are not absolutely neutralized by the use that they are put to, so that the liquors are still active and have to be "killed" before they are subjected to any operation for the recovery of the iron and of the acid in any form.

The sulphate "waste pickle" liquors, as they are termed, are killed or neutralized by the addition of scrap, producing a neutral solution from which copperas in the solid form is obtained, these liquors being one of the main sources of this material. When hydrochloric acid is employed ferrous chloride is produced, which is not so tractable a salt as the sulphate, owing to its great solubility; and, besides, the demand for it is insignificant when compared with that for sulphate.

The chloride liquors are consequently generally dealt with by adding some base, which, combining with the chlorine, will precipitate the iron as an oxide, and that which naturally suggests itself is lime. This has been employed; but the calcium chloride produced being also a very soluble and deliquescent substance with little use for it, the process can only be resorted to as a necessity. Certainly the calcium chloride solution might be run away, but a better use might be to employ it for watering roads and preventing the dust arising from the passage of motor cars, a use to which this salt is said to have been successfully applied. Potash and soda have also been suggested and employed as bases for the precipitation of the oxide of iron, but the product obtained has obviously a value much below that of the materials employed. To turn caustic soda into common salt cannot be a very profitable process, nor yet to use potash and obtain chloride of potassium.

The idea occurred to Dr. C. F. Wülffing, for some time a resident in the Swansea tinplate district, that ammonia might be employed to effect the precipitation in question, seeing that the value of the ammonium chloride is greater than that of the ammonia employed.

The great drawback to such a process naturally is that the volatile nature of ammonia requires special attention to be given to the apparatus employed, which must necessarily be closed, and every possible means of escape of the amonia prevented. Especially is this the case as the liquor has to be blown for a considerable period in the presence of ammonia, some of which the air carries off, and provision has to be made in the plant not to lose this ammonia.

The necessity for this blowing or oxidation arises from the fact that Dr. Wülffing's main object is to obtain a black oxide of iron, which is only produced after long exposure to the air blast. This oxide, which is obtained as a beautiful blue-black color, is quite insoluble in water, and when passed into the filter pres sleaves a clear solution of ammonium chloride which is evaporated and allowed to crystallize.

The blue-black precipitate is magnetic, showing it to be Fe_3O_4, and is a valuable addition to the list of pigments that can be employed with advantage for the protection of structural ironwork.

By similarly treating the chloride liquors with other bases a black color can be obtained, but it is not of the extreme fineness possessed by the substance when ammonia is employed. It is also necessary to consider that absolute chemical purity is unattainable whatever method may be employed. If the process be attempted with lime, some of this, which is a most undesirable impurity, remains behind, the color produced being, besides, of a poor quality. With ammonia, on the other hand, the black oxide is left with a trace of a double salt, which Dr. Wülffing regards as NH_4Cl, $FeCl_2$. This acts beneficially on the paint, although ammonium chloride by itself would not do so. Structures that have been painted with this blue-black oxide of iron (boiled linseed oil being used in the preparation of the paint) have kept fresh though exposed to the weather for nearly two years, still showing a varnish-like surface.

The Sharon Chemical Company, Limited, to whom Dr. Wülffing has assigned the English patent, are putting up a plant in Derby which will probably be working when this paper is read. The writer may avail himself of the opportunity granted to authors to make a more or less lengthy addition to this note should occasion arise after the plant is started.

*Paper read before the Iron and Steel Institute, September, 1907.

EXCHANGES

Mines and Minerals, September, has a paper on "Montana Gypsum Deposits." The refined gypsum products sell for about $8 per ton. From analyses quoted, Montana gypsum appears to be of exceptional purity.

The Mining and Scientific Press, September 14th, refers in its editorial columns to Mr. J. J. Hill's control of the Crow's Nest Pass mines. It makes the sweeping statement that Mr. Hill has the coking of coal of the Northwest under his thumb.

The Iron and Coal Trades Review, August 30th, contains an article on "The Housing of Workmen." The writer attributes to Germany the credit for originating most of the devices for improving the conditions of workshops. However this may be, there is a decided improvement in the style and comfort of modern English workmen's dwellings. The Brodsworth Main Coal Company, operating near Doncaster, recently offered a prize of £100 for the best design of a model village, consisting of 500 cottages, club house and shops, to cover an estate of 70 acres.

The Iron and Coal Trades Review's (September 6th) remarks on coal conditions and prices are timely. It is pointed out that the coal owners are not, as such, responsible for either the rise or the fall of prices. It is entirely a question of the "higgling of the market." For two years the demand for coal has been increasing in excess of the increase of supply. No coal owner can make the public purchase an ounce more coal than they want, nor an ounce less. The coal trade has many allied interests, and one of these—the great railway carrying interest—as we have pointed out in one or two recent issues, is taking care to secure as large a slice as possible of the higher prices that are being paid for coal.

BOOK REVIEWS

THE MANUFACTURE AND PROPERTIES OF IRON AND STEEL, BY HARRY HUSE CAMPBELL, FOURTH EDITION, FULLY REVISED; THE HILL PUBLISHING COMPANY, 505 PEARL STREET, NEW YORK; 640 PAGES, ILLUSTRATED. PRICE $5.00.

When, half a dozen years ago, the first edition of the "Manufacture and Properties of Iron and Steel" appeared, it was at once recognized as a standard. The fourth edition brings us a book different in many minor respects from the first, but retaining in perhaps more convenient shape all the marrow of the preceding edition. "By constant additions," the author prefatorily remarks, "the book had grown too big to be convenient, so that every line has been gone over to eliminate unnecessary phrases or words . . . On the other hand, much new matter has been added . . ."

The fourth edition has a number of pages less by 222 than the second edition. But the loss in bulk is amply compensated for by the added compactness and by the absence of matter of only temporary value.

Part I., as an introduction to the main principles of the metallurgy of iron, serves its purpose thoroughly.

That section of Part II. which describes the blast furnace is carefully written. A startling amount of information is compressed within its forty-seven pages. As this, to the young metallurgist, is one of the most important chapters, its value would have been increased had it included a simple method for calculating blast furnace burdens. However, as it stands, this chapter is wonderfully profitable reading. The author, being himself pre-eminent among American steel metallurgists, has been able to use much tabulated data, derived from experiments at his own works at Steelton, Pa. And the reader is at once impressed with the fact that Mr. Campbell is writing with a "first-hand" knowledge of his subject.

Most instructive is Part III., wherein are collected short sketches of the iron industries of the leading nations of the world. Again the reader has the benefit, to a certain extent, of the author's personal acquaintance with the foremost ironmasters of Europe and with many of the industrial centres referred to.

Regarded as a general text-book of the iron and allied industries, this volume stands unapproached by any book that we know of. The task of covering so much ground in such limited space is a Herculean one. The very need of such careful condensation points to the opposite need. Mr. Campbell's excellent book might well be supplemented by a series of books taking up each chapter, in regular order, and expanding upon each. The technical world, incidentally, is in particular need of practical books upon such subjects as the blast furnace and coal-washing.

CHEMICAL REAGENTS—THEIR PURITY AND TESTS. A NEW AND IMPROVED TEXT-BOOK, BASED ON AND REPLACING THE LATEST EDITION OF KRAUCH'S "DIE PRÜFUNG DER CHEMISCHEN REAGENTIEN AUF REINHEIT." BY E. MERCK. AUTHORIZED TRANSLATION BY HENRY SCHENCK, A.B., (HARVARD). D. VAN NOSTRAND COMPANY, 23 MURRAY STREET, NEW YORK, 1907, VIX., 250 pp. PRICE $1.50.

A convenient hand-book on the testing of chemical reagents has long been needed. Chemists, employed in industrial laboratories, are too prone to accept the label of the manufacturer as a guarantee of purity. And, even when they begin to suspect the absolute freedom of reagents from contaminants, they are often at a loss to apply tests at once rapid and complete. Not infrequently the inexperienced chemist does not know what impurities to search for in each reagent, and he must perforce exhaust a great many possibilities before he finds what he is looking for. Time is money in modern laboratories. Therefore any hand-book which is devised to save time for worthier objects is acceptable.

The book before us is evidently the product of a long experience. All of the principal reagents, inorganic and organic, are included in alphabetical order. Tests are given for the typical impurities of each and the distinguishing chemical and physical qualities of each are enumerated. An excerpt will illustrate the arrangement followed. Opening the book at random we come upon a paragraph headed "Bromine Water," which reads thus:—

BROMINE WATER.

A saturated, aqueous solution, containing about 3 per cent. of Br.

Tests of Purity.

Sulphuric Acid.—Add 0.5 c.c. of hydrochloric acid and barium chloride solution to 50 c.c. of bromine water, and boil the liquid until the bromine has been completely expelled from it. The precipitate of barium sulphate should separate on standing one hour.

Bromine Content.—Let 10 c.c. of bromine water run into a solution of 5 grammes of potassium iodide in 100 c.c. of water, allow to stand half an hour in a stoppered flask, and then titrate with decinormal sodium thiosulphate solution. 1 c.c. of decinormal $Na_2 S_2 O_3$=0.007996 gramme of Br., log. 90287.

Thus a ready method for testing for the chief impurity of bromine water is described, along with a determination of the strength of the reagent. The knowledge of these methods and the use of them will not only give the chemist confidence in his work, but will make for economy. Bromine water is a reagent which the chemist is apt to use far too liberally, thereby wasting material and much time. When the strength of reagents is definitely known it is possible to regulate quantities so as to effect a great saving of time in boiling and evaporation. Moreover, anything that tends to a strict standardization of chemical methods tends also to eliminate error and sloppiness.

Tables of atomic weights, corrected up to 1906, and of normal and decinormal solution equivalent are given on the last pages. An index is also included.

PERSONAL AND GENERAL

Mr. Alex. Longwell, of the Coniagas Mine, has taken a residence in Toronto for the winter.

Mr. Graham Fraser has recently visited Victoria and other points in British Columbia.

Mr. W. K. MacNeil, M.A., has returned to Cobalt after a few weeks' holidays. Mr. MacNeil has charge of the laboratories of Evans & Laidlaw.

A Prospectors' and Mineral Interests' Exchange has been organized in New Liskeard. The object of the organization is to protect the interests of buyers and sellers of mining claims. The membership fee is five dollars. One of he objects of the exchange will also be the elimination of middlemen's profits and of brokers' options. J. R. Lawless, New Liskeard, is president, and V. E. Taplin, of the same place, is secretary.

CORRESPONDENCE

Klondike—Cobalt.

To the Editor, CANADIAN MINING JOURNAL:—

I can still remember the fierce outcry in the Klondike district against the imposition of any royalty on gold mined there. The leaders in this opposition to the tax were Conservatives. It was therefore amusing and instructive to me to see the Conservative Government of Ontario impose a royalty on Cobalt silver, and to note the strong objections on the part of the Cobalters.

The imposition of this tax in Klondike and in Cobalt was due in a great measure to the boasts and to exhibitions of vast wealth by the owners of mines themselves. It is only necessary to say that Mr. Wm. Ogilvie did not even recommend the imposition of any tax (although blamed for it); the Government at Ottawa saw to that. In a like manner we may be sure that it was the Government at Toronto which moved, with reference to Cobalt. And each Government was and is right in doing so. As the only Canadian editor in Dawson for years, I bore the brunt of the defence of the royalty, and I have had no reason to change my mind. More especially as the Dominion Government protected the poorer miners by exempting productions of $5,000 and under, yearly. The royalty on the mine's production was, under pressure, modified to a general export tax of 2 1-2 per cent. on all gold exported from Yukon territory, and there it remains.

But the anti-royalty cry hurt the Government very much in Yukon, and the tax was denounced as "un-British" by its opponents. As a matter of course the product of many of the richest mines in the Klondike went into alien hands, and was taken out of Canada. Again other vast sums went into the hands of blackguards, gamblers, prostitutes and such; and the man who vehemently denounced the tax would in many cases throw away ten times the amount on wine, women and gambling. It was also useless to point out that British Columbia imposed a mineral tax.

It must be kept in mind that while an agricultural country goes on forever, a mineral country has only a limited life, especially where the deposits are of great richness. But when the population dwindles in sympathy with the decrease in production, the Government must continue, schools, public buildings, roads, law and order must be maintained from an insufficient revenue.

The Dominion Government has spent about all the revenue from Yukon in roads, public buildings, telegraph lines, police protection and such. In the matter of roads the chief blame was that their construction was not started earlier; but although tardy in beginning, the Government has (according to the evidence of the United States Senatorial party who visited Yukon and Alaska) redeemed itself with great credit. Let us hope the Ontario Government will do as well; and being so much nearer the field, it may not delay the construction of roads. The law and order enforced in Yukon has been pointed to with pride, and is a vivid contrast with that now maintained in the Western States and Alaskan mining camps.

Let me suggest two ways in which a portion of the fund collected from the tax on silver may be used to best advantage. First, by generous rewards to persistent, as well as to successful prospectors. There is where every Province in Canada fails miserably, and it is one of the keys to success in developing mineral wealth. And in addition to these rewards, life annuities should be granted to hard-working, persistent and intelligent prospectors whose good work is apparent, even although they may make no big discoveries themselves. In the Klondike it was the determined and intelligent prospector who although he found the wealth, did not participate in it, while the man who was not even a prospector stumbled on a small, but the richest part, of the gold fields, and made a fortune. The majority of successful pioneers and prospectors are financially improvident, and are utterly careless of old age provision. They are generous, and even if they profit by their discoveries, the proceeds slip through their fingers. Again, as in Robert Henderson's case, when he had outlined and discovered both the Indian River and Klondike gold fields, he was, by a quibble in terms at the recording office, deprived of his well-earned wealth. The fact that the Government acknowledged its mistake years after has not been of any benefit or a real reward. It is perhaps on a par with the grim irony of a Province voting a tardy little annuity to the dying daughter of a long dead discoverer; neither of whom profited by that discovery.

Secondly, the establishment of good homes for aged and disabled prospectors and miners, as in British Columbia. When a pioneer or prospector feels assured that he will not have to end his career in abject poverty, or by the leaden route, he can and will cheerfully devote the best years of his life, and all the vim of youth and middle age to his valuable work for the Province, and for Canada.

The matter in the above letter was written six months ago, but it was declined then by leading Ontario journals. It may be of interest to a mining journal which does credit to Canada.

Yours,

HENRY J. WOODSIDE.

Ottawa, 16th Sept., 1907.

To the Editor, CANADIAN MINING JOURNAL:—

I noticed an article on "Springhill and its Collieries," by W. D. Matthews, in your issue of 15th Sept. In this Mr. Matthews states: "It is generally conceded, however, that the Cumberland Railway & Coal Company has the best of it. Outside of their holdings it is doubtful if the remainder possess any great value."

I wish to contradict this statement. The Springhill seams are certainly among the best and thickest at the present time, but to claim them as being the only valuable seams in Cumberland County is, to say the least of it, presumptous. How can Mr. Matthews claim exclusive value for their holdings, which in many instances are either sandwiched in between or in close proximity to holdings in active operation by other company, and whose seams are just as good in quality, if not better, than those at Springhill. Furthermore, I was not aware that a coal basin existed at Springhill. I was always under the impression, and am still, that they are part and parcel of the Cumberland coal basin and on an equal footing, in this respect, with the rest of the mines whose good fortune it is to be operating in this large and valuable coal field.

Trusting you will give this space in your valuable JOURNAL, and with apologies, I am yours very truly,

ROBT. ARCHIBALD.

Eastern Coal Company, Maccan, N.S.

Mr. H. E. T. Haultain passed through Toronto on September 20th, having completed a tour of certain American centres in the interests of the Canada Corundum Company, of which Mr. Haultain is the general manager. Mr. Haultain visited consumers of corundum in Wisconsin, Illinois, Indiana, Kentucky and Tennessee.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.—Glace Bay has been more or less *en fete* during the past week in honor of the visit of the National Trades and Labor Congress of Canada, at the invitation of the Provincial Workmen's Association. To welcome, and incidentally to impress the visiting delegates the P. W. A. arranged a rather interesting parade, which was held on the evening of the 10th. The various P. W. A. lodges turned out in force, and all the "boys" of the Coal Company's fire brigades were there in blue and white. About three hundred of the miners in the parade carried lighted safety lamps, which must be growing in favor. Two large floats carried enormous blocks of coal, at which two men worked, one with handpick and the other with machine-pick, to show the old way and the new, a la the Ingersoll advertisement. One of the leading spirits of Ironside Lodge wore the Draeger breathing apparatus, and seemed to enjoy himself. We hardly understand, however, why he chose to ride, and he looked an odd "rescuer" sitting in in a carriage! The new town fire engine, the "John Leaman," was there under a full head of steam, with a mine tub full of coal in its immediate rear. The coal was No. 6, guaranteed the genuine article, and the fire engine bore the legend: "Modern fire engine, burning No. 6 coal!" This was a somewhat significant item of the procession, as showing the temper of our Glace Bay people in the matter of the aspersions that have been cast upon the fair name of their coal seams, and we think it was rather a sly dig at a neighboring city that piques itself upon its fire brigade. The parade was a most unqualified success, and was witnessed by a well-dressed and orderly crowd of about fifteen thousand people. Such a gathering points to a growing spirit of local patriotism and pride in our mining industry that augurs well for the district as a whole, for, split up into hostile camps as we are by race and sects and politics, it is not often that a united and general effort is so enthusiastically carried out.

Most of the visiting delegates spoke the French language only, and the proceedings of the conference were carried on in both French and English, with asides in Gaelic we are told. One of the merchants in town displayed two greetings. One read: "Comment ca va" and the other ran "Camar ha sibh dhu." Such a juxtaposition of the language of courts and diplomacy with that primeval tongue that lingers in Cape Breton arouses a train of thought that leads one far afield from the dust and grime of our collieries to the old-time friendship of Scotland and France before Louisburg fell and the Bastile became a tradition. It is a far cry from the court of St. Louis to the Glace Bay Hotel, and one would hardly think there was any of the glamour of romance and history about a P. W. A. gathering in Glace Bay. Yet there is. This island is rich in historical tradition and in an old world tongue and literature that carries us back to Fingal and Ossian and the mists of Gaelic tradition. We wonder why the young Cape Bretonian is ashamed of his Gaelic speech. He has no reason to be, and there are many reasons why he should be proud of the fact. The Welsh miner does not speak the tongue of the Sassenach, nor does the French-Canadian. But to be practical, we understand that the P. W. A. intend to affiliate with the Upper Canadian organization before referred to. Well, stranger things have happened.

The P. W. A. will hold its Grand Council meeting at Halifax on the 17th. There are several things for them to discuss. The three years' agreement with the Dominion Coal Company expires at the end of this year, and it will in all probability be renewed. The agreement has worked well, and save the stoppage of No. 1 on the question of working with non-unionists, there has been no hitch in the relations of the Coal Company with their men since the contract was signed.

The Grand Council of the P. W. A. will also, we understand, take up the question of old age pensions for miners. The Nova Scotia Legislature at their last session appointed a committee to "examine into and advise upon the advisability of adopting some scheme of providing old age pensions for workmen, and particularly for such workmen as have either by themselves or in conjunction with their employes, established benefit or relief societies, etc." The Commission will sit in Glace Bay on the 25th inst. to take evidence and examine witnesses. It is composed as follows: Chairman, Walter Crowe, barrister, of Sydney; Hon. Robt. Drummond, of the *Mining Record*; Stephen B. McNeil, Grand Master of the P. W. A., and Wm. Hodge, of Springhill. It will be seen that the Commission is a very representative one. We commend to the Commission a careful study of the constitution of the Provident Society known as the Knappschafts-Verein in the collieries of Westphalia in Germany. Under the German law membership in this organization is compulsory upon all mine employes. The funds are contributed in the proportion of one-third each by the Government, the workpeople and the employers, and the benefits are sick relief, death bounties and old age pensions.

The output of the Dominion Coal Company for the first fortnight of September is small, owing to the fact that it contains three Sundays and Labor Day, but during the latter half of the month its is expected to materially increase. The labor conditions are improved, and from now to the close of navigation the output will reach 15,000 tons a day or thereabout.

During August the shipments were very large, being over 365,000 tons for the month. The huge banks that were accumulated last winter have practically disappeared.

The reconstruction work at the Hub Mine is now practically completed, and everything is ready to hoist coal. It is not probable, however, that any great amount of work will be done this season owing to the scarcity of labor. It is the intention of the management to install a modern electrical endless haulage system at once, and when the Hub begins to hoist coal again it is expected to obtain well over the thousand tons per day. No person looking at the modern layout of the Hub Mine to-day would recognize the smoking chasm which was all that was left by the fire last December.

The Coal Company are advertising for tenders for the construction of seven miles of railway to connect their Sydney and Louisburg line with their proposed new colliery at Barrachois, and it is said that considerable developments are contemplated in that neighborhood. As yet, however, the Coal Company have not made any statement to this effect.

We understand that considerable developments are expected at the old Gowrie mines at Port Morien. Mr. B. F. Pearson, of Halifax, accompanied by Dr. J. A. Henderson, of London, Eng., visited the colliery on the 7th inst. and inspected the plant. Mr. Nicholas Richardson, of Newcastle, England, is the newly appointed manager, and under his supervision the management are installing additional boiler power, new hoisting engine, etc. For some time past the mine has been practically idle, only enough coal being hoisted to keep the pumps going, and the promise of new for the old mine is welcome to the Port Morien people.

ONTARIO.

BRUCE MINES.—The party of British journalists who, at the invitation of the Ontario Government, whose guests they now are, crossed the Atlantic on the Lusitania, visited Bruce Mines on September 18th under the guidance of the Hon. Frank Cochrane. The party numbered sixteen, all representatives of leading English journals.

They were met at the station by Mayor Knight and a company of leading citizens. A breakfast was served at the Exchange Hotel, at which speeches were made by the hosts and responded to by the vsiitors. Mr. T. Hayes-Sheen occupied the chair. His

address was a strong presentation of the advantages and claims of Bruce Mines. He referred to the indefatigable efforts of the Hon. Mr. Cochrane in advancing the mining interests of Ontario, and, also, to the good work done by Mr. W. R. Smythe, the local member. With Mr. Cochrane's consent Mr. Hayes-Sheen announced that, under the auspices of the Local Government, a preliminary survey was being made to define a railway route to connect Bruce Mines with the C. P. R. main line..

This line, later on, is to be projected northwards towards James Bay.

The Hon. Mr. Frank Cochrane spoke briefly of the desire of his Government to further the development of the vast natural resources of Northern Ontario.

Both Mayor Knight and Mr. W. R. Smythe made short speeches.

Representatives of the *Morning Post,* the *Tribune* and the *Standard* made happy responses.

After breakfast the visitors were shown over the Bruce Mines plant.

BRITISH COLUMBIA.

THE KOOTENAYS.—The coke question still remains an ardent issue in this district. While there has been more or less improvement in the situation during the past two weeks, a majority of the smelters are running "from car to furnace," and if there should be any marked interruption in the scant supply it would undoubtedly mean the closing of some of the plants. Nothing has been heard of Mr. Tolmie's findings, although he has gone thoroughly over the ground. However, it is hoped that fuel conditions will steadily improve, and that the various mining and smelting concerns will have a bounteous supply of fuel stored in their bins as a reserve before old Boreas puts in his appearance and renders transportation a problematical matter.

Shipments from Rossland camp are necessarilyq still curtailed. Le Roi Mine is on the shipping list again and are shipping 1,500 to 2,000 tons per week. Consolidated properties are shipping from 2,500 to 3,000 tons per week. Le Roi 2, Limited, are shipping several hundred tons per week. The lessees of the Nest Egg have shipped two cars of ore and have realized a profit from the same far in excess of their expectations. The White Bear Mine shipped three car loads of ore, about 105 tons, and a car of concentrates, during the week just ended. The concentrates represent 350 tons of second-class ore milled. It is pleasing to learn that this property is now paying its own way and returning a small sum each month to its treasury.

Hearsay has it that A. I. Goodell, of the Northport smelter, has handed his resignation to Le Roi management. Mr. A. G. Larson, superintendent of the mine, has gone south on a holiday for a month, but it is said that he has been proffered a couple of choice positions and, owing to some little friction in Le Roi affairs, may accept one of the offers made. It is too bad that a meritorious concern like Le Roi should be continually laboring along under a load of trouble. The mine pays liberal tribute to those who hold the reins of its government and still seems to be almost powerless to unburden itself; at least to any considerable degree. The management of this concern no doubt will have to exercise a sane and far-seeing policy if they would lighten this load and divert part of the revenue from the property to the purses of the shareholders.

At Northport there are three furnaces being operated in the smelter. Trail smelter is running at about half capacity, principally owing to the scarcity of fuel. The Boundary smelters are all running along fairly well, with the exception of the plant of the British Columbia Copper Company, which was a little short of fuel last week. Nothing of signal interest developed in the Boundary mines since last writing. As with the Rossland mines, the usual development work and shipping was done, as well as possible, under existing conditions.

The shareholders in this country have just received their cheques for the British Columbia Copper Company's last dividend. The Granby has just declared another dividend of $405,000. These, with the Consolidated making regular divisions of profit quarterly, and other propositions showing up on the list from time to time, place this district in a far better position, from the investor's point of view, than that which it occupied a few years ago.

Railway construction is active in the Boundary and Similkameen districts. They will have excellent transportation facilities in that section in the very near future.

At last it is authentically stated that J. J. Hill and Great Northern interests have acquired a large interest in the Crow's Nest Pass Coal Company, and that the Granby Company have invested about $700,000 in Crow's Nest stock. There are rumors of changes in the mine management, many denials from various quarters, but the suggested changes would be welcome to the interests in this country if a sufficient supply of fuel would be the result.

Naturally, the prevalent agitation against Asiatic labor is a question of importance and interest to the people here. Several organizations have passed resolutions condemning the uncontrolled admission of Oriental laborers to Canada, and British Columbians generally are vehement in the stand they take against the Asiatic hordes being allowed to swarm over this country. It is contended that there is no justice in permitting the Oriental to despoil the future, as well as the living, white race of the opportunities and prerogatives that are theirs by birth and education. Without actually going through the experience, it is almost safe to say that the admission of thousands upon thousand of Asiatics would have a pernicious effect upon the white laboring class, of a few decades hence more particularly. While the rioting at Vancouver is not countenanced by the every day law-abiding individual, it is hoped by all that the affair will serve to culminate this matter and that a decisive move will now be made by the Government towards a settlement.

GENERAL MINING NEWS

NOVA SCOTIA.

LONDONDERRY.—The blast furnace of the Londonderry Iron & Mining Company was blown in on September 7th. The furnace has been partially relined under the direction of William Scurrah. During the last three months the entire plant of the Iron Company has been put in excellent shape. The "blowing-in" was an event of great local importance.

HALIFAX.—The Provincial Workmen's Association has emphatically protested against the Industrial Disputes Act. The objections raised are based upon three points:—1st, That much delay is experienced in putting the Act into operation; 2nd, that witnesses summoned before the Board do not receive sufficient remuneration, 60 cents per day being the fee paid; 3rd, that the advice of the P. W. A., as a body, had not been asked. The organization is also taking up the matter of the low wages paid to outside laborers at the mines.

PORT MORIEN.—It is expected that the North Atlantic Collieries Company will commence shipping coal early in October. Repairs on the shipping pier, on the towers of the aerial cableway and on the chutes are being pushed with vigor. The dwelling houses are completely repaired.

The Nova Scotia Steel & Coal Company has decided to grant an increase in wages to the engineers, firemen, conductors and brakemen. The engineers wil lreceive 27½ cents per hour; firemen, 20

cents; brakemen, 19 cents; conductors, 22½ cents. A comparison of the new with the old rates stands as follows:—Conductors—Old rate, 25 cents per hour; new rate, 27½ cents per hour. Firemen—Old rate, 20 cents per hour; new rate, 17½ cents per hour. Brakemen—Old rate, 19 cents per hour; new rate, 17 cents per hour. Conductors—New rate, 22½ cents per hour.

Port Hood.—The Port Hood-Richmond Railway Coal Company installed a Sullivan straight line air compressor early in September. It will be used to operate the pumps and the coal-cutting machines. The old compressor will be repaired and kept in commission. The company has determined, with the assistance of the Provincial Workmen's Association, to eradicate heavy drinkers from their employ. Those who fail to work 22 days in the month will be dismissed, unless due cause can be shown for their absence. In spite of shortage of labor, the mine is raising 400 tons of coal per day. An output of 1,000 tons daily is counted upon next year.

ONTARIO.

Cobalt.—Six carloads of ore have up to the present been shipped from the Cobalt Townsite Mine. The main shaft is down over 100 feet, No. 2 shaft is down 50 feet, and about 620 feet of drifting and cross-cutting has been done at the 50 foot level. Fifty men are now employed and the number will be increased.

The shaft of the Big Pete Mine is now 170 feet. The ore is from two to three feet in width. The vein is vertical and the pay chute dips at sixty degrees in the vein. The company is installing a concentrating plant of 100 tons capacity. The plant consists of one 10 by 20 Blake crusher; one set of 42 by 14 roughing rolls; one set 32 by 12 medium rolls and one set 32 by 10 fine rolls. From the coarse rolls the material passes through screens where the size between three and eight mesh is removed and sent to two-compartment jigs. The under size from the eight mesh screen goes to a twenty mesh screen. The over size from this goes to a three-compartment jig, the undersize going to a hydraulic classifier. The tailings from the two-compartment jigs goe to the medium rolls, and are then crushed and elevated to a twenty mesh screen, where the fines are removed and the oversize goes to three-compartment jigs. The tailings from the three-compartment jigs pass through the fine rolls, where the material is crushed to twenty mesh. All material after passing the twenty mesh screen goes to a hydraulic sizer of two compartment, each compartment giving a different table product. The overflow from the sizer goes to Callow settlers and from settlers to vanners. In all cases the oversize from screens is returned to the rolls until it passes the twenty mesh screen. The company experimented with four car loads of ore before deciding upon the necessary machinery. Any additional treatment, required in the future, will be along the lines of pan amalgamation. The company is now installing a larger hoist and a 1,500 foot compressor. The entire plant will be in operation during October.

Cobalt.—The concentrating plant of the Cobalt Central Mine will very shortly be in operation. Low grade ore has been stacked in quantity sufficient to keep the concentrator running for some weeks, and the company will attempt to keep a large reserve always on hand.

The Buffalo Mine is making strong progress. The full complement of men are working and the camp quarters are to be enlarged.

The Silver Bar Mine, which has been lately in the control of Rinaldo McConnell, of Ottawa, and J. E. H. Barnett, of Renfrew, passed into the hands of J. P. Killorin, of Duluth, Minnesota, and E. P. Stone and associates of Saginaw, Mich. The reoganization of the company took place in Ottawa Saturday. E. P. Stone was elected president and managing dicector. Charles McRae, of Sudbury, is secretary-treasurer. The head office will be removed from Ottawa to Sudbury. A new engineer has been appointed to thoroughly overhaul the machinery and have operations commenced as soon as possible.

The Coniagas Mines, Limited, is appealing to the Ontario Railway and Municipal Board against an assessment of $100,000 fixed by the Town of Cobalt for the purpose of levying an income tax. The proprietors claim that they are not liable to taxation on income.

Letters received by the T. & N. O. Railway Commisison from their mining engineer, Mr. A. A. Cole, announce the discovery of promising quartz veins five miles north of Temagami station. On one property that was being developed for molybdenum, free gold was found.

The report that La Rose Mine has been sold to an English syndicate is being persistently circulated. Although shipments have been light, yet La Rose is in fine condition. Cross-cutting and drifting have been vigorously pushed. A large quantity of ore is blocked out on the second and third levels.

The Coniagas concentrator is now operating. It will have a capacity of 100 tons of low grade ore per day. The slimes from the ore will be caught in settling tanks.

Port Arthur.—Five carloads of silver concentrates, valued at $40,000, have been shipped to United States smelters by the Hanson Consolidated Mines at Port Arthur. During August this company milled an average of 50 tons of ore a day, the total being 1,500 tons for the month.

Wabigoon.—Inspector E. T. Corkill recently visited four actively operating mines in this district—the Laurentian, the Paymaster, the Victory and the Detola. Mr. Corkill has been quoted as being favorably impressed with the progress of the camp.

Sault Ste Marie.—The rail mill of the Superior Corporation re-opened on September 9th. It had been closed down for two weeks. No. 1 blast furnace is now relined. The ore supply is looking more promising.

September 16th and 17th the visiting British journalists spent at Sault Ste. Marie. After visiting the pulp mills and other points of interest on Monday evening and Tuesday, a dinner was tendered them on Tuesday evening at the International Hotel. About 100 prominent citizens were among the guests. After leaving Sault Ste. Marie the following itinerary was adhered to:—

Wednesday, September 18th.—Morning, Bruce Mines—Ontario Copper Mining and Smelting Company. Afternoon, Blind River—Inspection of Eddy Brothers' lumber plant and other mills. Evening,Espanola—Spanish River Pulp & Paper Company's plant.

Thursday, September 19th.—Morning, Crean Hill, property of Canadian Copper Company. Afternoon, Victoria Mines—Mond Nickel Company's mine. Evening—Sudbury.

Friday, September 20th.—Copper Cliff—Visit to the celebrated Creighton mine and smelter, property of the Canadian Copper Company. Evening—Sudbury.

Saturday, September, 21st.—Trip over C. N. R. into Hutton Township to the Moose Mountain Iron Mine. Evening—Off to Temagami.

Sunday, September 22nd.—Resting on Lake Temagami, situated in the largest of Ontario's pine forest reserves.

Monday, September 23rd.—Cobalt—Visit to various silver mining properties. Evening—Haiyelbury, prettily situated on Lake Temiskaming.

Tuesday, September 24th—New Liskeard, the gateway to the great Clay Belt. Evening—Return to Toronto.

Wednesday, September 25th—Luncheon at the Speaker's Chambers, Parliament Buildings, Toronto, at 1 p.m., to meet His Honor the Lieutenant-Governor and representative newspaper men of the Province.

ALBERTA.

Coleman.—Mr. A. C. Flumerfelt, president of the British-American Trust Company, the International & Alberta Coal & Coke Companies, located respectively at Coleman and Lundbreck, Alberta, associated with Andrew Laidlaw, of Spokane, and H. N.

Galer, vice-president and genera lmanager of the International and Alberta Coal Companies, has completed negotiations for the purchase of 7,000 acres of coal land, located four miles north of Lethbridge on the east banks of the Belly River, directly opposite the Diamond mine, now being deveolped. The purchase price is stated to be $350,000. The company to develop the property will be called the Royal Collieries Coal Company.

LUNDBRECK.—Overground improvements are being made at the collieries of the Galbraith Coal Company. About $20,000 will be expended. A tramway 1,700 feet long, loading bunkers and a modern hoisting plant are to be constructed.

BRITISH COLUMBIA.

An English syndicate has acquired 360 acres of coal lands on Vancouver Island, four miles from Nanaimo. The lands adjoin the Dunsmuir coal mines. The vendors were the West Wellington Colliery Company, and the consideration was considerably over $375,000. Prospecting with diamond drills is being vigorously carried on.

BOUNDARY.—Last week the new electric compressor, which was ordered some eight or ten months ago from the Allis-Chalmers-Bullock, Limited, by the Crescent Mines, Limited, arrived in Greenwood, and is now being installed as rapidly as possible at the company's mine, being of seven drill capacity. Power will be furnished by the Greenwood City Waterworks Company.

One carload of concentrates will shortly be shipped from the Cariboo-McKinney.

As eight furnaces are now in commission at the Granby smelter, about one car of blister copper is being shipped daily.

The mines of the Granby Company are working at full capacity. Five hundred and fifty men are employed.

Since the British Columbia Copper Company took over the Lone Star mine, nearly 1,600 feet of development work has been done. Most of the work has been in ore. In the near future a diamond drill is to be shipped to the Lone Star.

On September 7th there were eleven furnaces in blast at Boundary's three smelters, six at Granby, two at the British Columbia Copper and three at the Dominion Copper. This is one more than the previous week and it indicates an easing of the coke situation.

VANCOUVER.—Reports have been received of the discovery of coal measures on the mainland of British Columbia in the Harrison Lake country. The exact locality is known only to the prospectors themselves. If coal is there in quantity, it will be easily shipped by a direct water route to Vancouver City.

Under the name of the Hewitt Mining Company, a group of Eastern American capitalists has got control of the Hewitt mine. The company has a capitalization of $800,000, divided into 80,000 shares of $10 each. The properties are the Hewitt, Lorna Doone, both considerable shippers, Rincon, Rincon Fraction, Mole, Crow, Tranquility, Lorna Doone Fraction, Panobscot and Prior, all crown granted. In addition the company has acquired the Silver Wedge group of the three claims on the same vein and the Reid and Tenderfoot on the Wakefield vein. An option has also been taken on the Wakefield group of 12 claims and one the Wakefield mill of 120 tnos daily capacity, which at present is treating the ore of the Vancouver, near the Hewitt, operated by the Le Roi No. 2 of Rossland. From the Wakefield over $300,000 worth of ore has been shipped from two claims, none of the others having been worked. From the Reid and Tenderfoot a recent shipment of a car of 32 tons of ore the to Trail smelter gave returns of 83.5 ounces in silver and 36 per cent. lead. From the Hewitt and Lorna Doone have been shipped since July, 1904, to March 22 of this year, 1,780.3 tons of ore having a net smelter value, ofter deducting freight and treatment, of $73.99 per ton. The Davys lease has netted the lessor $50,000, two-fifths of which was during the first six months of the year.

LADYSMITH.—On No. 6 level, No. 2 sslope of No. 2 Extension mine, six men were seriously burned by an explosion of gas. The men had just reached their work when the explosion occurred. Although it was a very heavy explosion, its effects were local.

NELSON.—Several new mines have become shippers during the pas week. The progress on the Hewitt is satisfactory. A good body of ore has been struck in No. 3 tunnel. The smelters are getting back into normal working shape.

PHOENIX.—The pay rolls of the mining companies operating near Phoenix amounted to a smaller sum in August than usual, owing to the coke shortage.

YUKON.

Dawson, Y. T., Sept. 12.—One of the most gigantic placer deals in the history of the world was made here when 200 mining claims on Dominion Creek were purchased by corporate interests. Records of the transfers have been filed in the gold commissioner's office in Dawson.

It is understood that all the paying portions of the Dominion Creek will be taken over, aggregating perhaps 350 to 400 claims. Frank. W. Morrison, as trustee, has secured 125 of the claims, and Peter Rost has secured the remainder. The new owner is a rich California company.

The ground just bought on Dominion Creek extends from number 10 above Upper Discovery to 223 below Lower Discovery, a distance of 20 miles. Dominion is the longest paying creek in the Klondike camp, and has yielded many fortunes. It is the richest stream on the Indian side of the high divide, and the first stream on that side to be bought by the big corporation. Granville camp, which comprises the lower few miles of Dominion Creek, has been purchased recently, presumably for the Morrison people. Indian River is 30 miles long, and also is the extension of Dominion, which is staked from end to end. Gold Run, Sulphur, Eureka, Quartz and other rich creeks have been organized to a large extent, and also may be bought.

The Guggenheims have now more than 1,700 men on their pay roll in the Yukon. They are pushing operations vigorously.

Hydraulicking has been much interfered with on account of the very dry summer. In fact very little hydraulicking has been carried on at all. Dredges, however, to the number of seven, are in commission, and five more are being assembled and made ready for next year's work.

The Yukon River is lower than ever known. Steamers have difficulty in getting to Dawson City. As a result it is predicted that there will be a shortage of provisions in Yukon this winter.

The otput of gold this season will not exceed $3,000,000.

MINING NEWS OF THE WORLD

GREAT BRITAIN.

For the first six months of 1907, the Dolcoath Mine reports 51,000 tons of rock crushed, 799 tons of concentrates sold and 64 tons of slimes. The rock tonnage is greater than during the preceding six months and the concentrates and tailings less. The higher prices obtained, however, compensate for this decrease.

UNITED STATES.

CALIFORNIA.—From the Tuolumne district comes the report that the Black Oak Mine, formerly owned by eastern people, has been purchased by a Nevada syndicate. It is to be worked on a large scale.

MICHIGAN.—The Michigan Smelting Company, near Houghton, made a record recently. A furnace charge of 2,000,000 pounds of copper was successfully tapped and poured.

MEXICO.

MONTEREY.—Another terrible mine fire occurred at the Esperenza mines, in which 27 miners were killed.

SOUTH AFRICA.

CAPE COLONY.—Exports of diamonds from South Africa for 1906 have been estimated at $46,287,655. A tax of 10 per cent. on raw diamonds woul dmean $3,400,000 a year to Cape Colony. This tax is practically double the previous 5 per cent. income tax, which it supersedes.

The gold output of Rhodesia South reached 55,000 ounces in June and nearly that figure in July. Many of the larger plants are being materially added to.

Commercial Paragraphs

The Chemists' and Surgeons' Supply Company of Montreal have recently supplied McGill University with fifty-five record microscopes for their pathological department.

Conveying and Transmission for August has been received. It is published by the Stephens-Adamson Manufacturing Company, Aurora, Ill. Among other illustrations are some of their "S-A" metal apron conveyors.

Mining and milling interests throughout the country will be interested in knowing that the Boston Consolidated Copper Company's 3,000 ton mill is nearing completition and will go into service at no distant date. Particular interest attaches to this mill by reason of the fact that the Boston Consolidated Company made such exhaustive tests of various types and makes of equipment before deciding upon the installation of Nissen gravity stamps, which they purchased of Fairbanks, Morse & Company. The mill, when completed, will be the largest gravity stamp mill in the world, and is expected to show some very remarkable results.

Fairbanks, Morse & Company, of Denver, recently placed on the market an improved air hammer drill, which they manufacture under the name of Sinclair Drill, H. L. Sinclair being the patentee. This improved drill is an all-steel machine, as are all Sinclair drills, and is equipped with air feed column, being quite similar in construction to the standard Sinclair air hammer drill. It has, however, a drilling capacity which is double that of the standard hammer drill, and has frequently demonstrated an average drilling capacity of 8 inches to 10 inches per minute in the hardest granite obtainable in Denver. The manufacturers report a very strong demand for these machines, and have completed arrangements for largely increased output.

Company Notes

A quarterly dividend of one per cent. has been declared on the common stock of the Dominion Coal Company, Limited, payable October 1st, 1907, to shareholders of record at the closing of the books on September 20th, 1907.

The annual meeting of the Granby Company has been called for October at the New York office, when the reports for the company's fiscal year, ended June 30th last, will be made public. Notwithstanding the great drawbacks of fuel and car shortage last winter and spring, curtailing operations at mines and smelter to a considerable degree, the report is expected to make a favorable showing.

At meetings of subsidiary companies of the Amalgamated Copper Company, in October, dividends of all constituents will be reduced from 40 to 50 per cent. it is expected Amalgamated Copper directors will declare a dividend of about 1 per cent. for the quarter, as compared with 2 per cent. in previous quarter. Anaconda dividend will be $1 or $1.25 a share for the quarter, as compared with $1.75 in the previous quarter. Boston and Montana about two months ago declared quarterly dividend of $2 a share and ten dollars extra. Dividends at the meeting next month will probably be 50 per cent. less. These reductions, as is well known, will be due to the demoralized condition of the copper market.

STATISTICS AND RETURNS

The output of the collieries of the Crow's Nest Pass Coal Company for the week ended September 20th was 21,905 tons, or a daily average of 3,651 tons. For the corresponding week of last year the output was 19,586 tons, a daily average of 3,264 tons.

British Columbia ore shipments, week ending September 14th:—

Following were the shipments and smelter receipts in Southeastern British Columbia districts for the past week and year to date:—

Boundary, 33,349, 840,585; Rossland, 3,344, 187,168; Eastern Columbia, 2,932, 97,724; total, 39,625, 1,125,477.

Smelter receipts: Grand Forks, 19,827, 446,933; Greenwood, 5,487, 235,983; Boundary Falls, 6,031, 133,270; Trail, 5,677, 164,769; Northport, 1,489, 67,838; Marysville, 600, 22,600; Nelson, 11,360. Total, 99,111, 1,062,733.

CROW'S NEST OUTPUT.

The output of Crow's Nest Pass Coal Company for the week ended September 13th was 22,962 tons, a daily average of 3,827 tons. For the corresponding week of last year the output was 19,493, a daily average of 3,242 tons.

COBALT ORE SHIPMENTS.

The Temiskaming & Northern Ontario Railway Commission report the following ore shipments from Cobalt for the week ending Saturday, September 14th:—

	Lbs.
Foster Mine	62,950
Silver Queen	120,000
Buffalo	60,00
La Rose	43,800
Total	286,750

Departmental returns show that the following were the coal exports from the Crow's Nest Pass, which were passed by the custom house at Nelson for the first six months of the current year:—January, 33,290 tons, value, $76,405; February, 31,955 tons, value, $63,919; March, 51,905 tons, value, $105,874; April, 13,934 tons, value, $27,898; May, 9,276 tons, value, $19,692; June, 28,236 tons, value, $56,059.

Coke from Crow's Nest Pass passed by Nelson custom house for export for first six months of the year was:—January, 3,313 tons, value, $13,333; February, 3,716 tons, value, $18,258; March, 7,132 tons, value, $32,519; April, 5,821 tons, value, $13,407; May, 950 tons, value, $4,121; June, 3,083 tons, value, $13,869. July and August returns are not completed. Totals for fiscal year ended June 30, 1907, are:— Coal, 282,598 tons, value, $590,117; coke, 22,907 tons, value, $108,398.

Following are the ore shipments and the smelter receipts in Southeastern British Columbia for the week ending September 7th and year to date:—

Shipments—

	Week.	Year.
Boundary	22,463	807,116
Rossland	4,616	183,724
East of Columbia River	2,682	90,165
Total	29,761	1,081,005

Smelter receipts:—	Week.	Year.
Grand Forks	12,549	434,106
Greenwood	3,941	230,496
Boundary Falls	4,930	120,239
Trail	4,848	159,092
Nelson	26	11,340
Northport	1,694	67,319
Marysville	600	21,600
Total	28,588	1,044,192

Dominion Coal Company's outputs, 1906 and 1907:—

	1906.	1907.
January	231,606	252,248
February	225,716	225,988
March	310,220	212,831
April	296,417	316,384
May	323,777	327,269
June	325,991	319,560
July	318,291	314,559
August	331,716	325,930

Dominion Coal Company's output, September 1 to 15:—

	Tons.
No. 1	18,360
No. 2	24,330
No. 3	11,540
No. 4	17,770
No. 5	25,950
No. 6	8,300
No. 8	9,030
No. 9	13,200
No. 10	3,730
Total	132,210
Shipments	132,814

The shipments of coal by the Nova Scotia Steel & Coal Company compare as follows:—

Shipments August, 1907	81,590
Shipments August, 1906	74,873
Increase August, 1907	6,717
Shipments 8 months, 1907	404,880
Shipments 8 months, 1906	410,598
Decrease 8 months, 1907	5,718

COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

Buffalo—Week ending Sept. 14, ore in pounds, 60,000; since Jan. 1, ore in pounds, 1,738,830.

Foster—Week ending Sept. 14, ore in pounds, 62,950; since Jan. 1, ore in pounds, 319,306.

La Rose—Week ending Sept. 14, ore in pounds, 43,800; since Jan. 1, ore in pounds, 1,102,102.

Silver Queen—Week ending Sept. 14, ore in pounds, 120,000; since Jan. 1, ore in pounds, 772,157.

The total shipments for the week were 286,750 pounds, or 143 tons.

The total shipments since Jan. 1, 1907, are now 17,628,210 pounds, or 8,814 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196 in 1906, 5,129 tons, valued at $3,900,000.

METAL, ORE AND MINERAL MARKET.

Aluminium No. 1 grade ingots—45 to 47 cents per lb.
Antimony—9 1-4 to 11 cents per lb.
Arsenic, white—7 1-2 to 7 3-4 cents per lb.
Barytes, crude—$11 to $15 per ton.
Bismuth, metal—$1.50 to $1.75 per lb.
Cadmium, metal—$1.35 to $1.40 per lb.
Carbons for drills—$75 to $85 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt Ont., unrefined—25 to 40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$12 per short ton.
Flourspar, lump—$10 per short ton.
Graphite, domestic—$50 to $150 per short ton.
Gypsum, lump—$4.50 per long ton.
Infusorial earth, ground—$15 to $30 per ton.
Lead—4.75 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$50 to $80 per ton.
Mica, scrap—$10 to $15 per ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.
Nickel, metal—45 to 55 cents per lb.
Platinum, ordinary metal—$28.50 per ounce.
Platinum, scrap—$23 to $24.
Pyrite, 38 to 45 per cent. sulphur, lump ore—10 1-2 to 11 3-4 cents per unit.
Quicksilver—$40 to $41 per 75 lb. flask.
Sulphur—$23 per long ton.
Talc—$18 to $25 per ton.
Tungsten, pure metal—$1.28 per lb.
Tungsten ore, 60 per cent. pure—$9 per unit.
Tin.—37 3-4 cents per lb.

MARKET NOTES.

Spelter.—Again the price of spelter has dropped. New York, 5.15 cents per lb.; London, £21. 5s.

Lead.—The American Smelting & Refining Company has reduced the price of lead to 4.75 cents per lb. This price obtains firmly in New York. London, £19 15s. for Spanish lead.

Tin.—The tin market has jumped up and down over a wide range. New York prices are steady at 37 3-4 cents per lb. London, £167 15s. for spot.

Copper.—Copper is unsettled at 15 cents to 16 1-4 cents for lake, 14 3-4 to 15 1-5 cents for electrolytic. Activity is expected in the near future. London, £66 15s. for spot standard.

Silver.—Sept. 5, 68 1-8; Sept. 6, 68 1-2; Sept. 7, 68 1-2; Sept. 9, 68 3-8; Sept. 10, 68 1-8; Sept. 11, 67 3-4; Sept. 12, 68; Sept. 13, 67 3-4; Sept. 14, 67 3-4; Sept. 16, 67 7-8; Sept. 17, 67 5-8; Sept. 18, 67 5-8.

Mexican dollars, 52 1-2 cents; sterling exchange, $4.854.

Pig Iron.—Pittsburg—Bessemer pig, $22.90; No. 2 foundry, $22.25.

Iron Ore.—Bessemer, old range, $5; Bessemer, Mesabi, $4.75; non-Bessemer, old range, $4.30; silicious, non-Bessemer, $2.50.

Quicksilver—$40 to $41 per 75 lb. flask.

New Dividends

Nipissing Mines, Limited, have declared the regular quarterly dividend of 3 per cent., payable October 21st. The directors of the Nipissing Mining Company, the operating concern, declared a lump sum divided of $180,000, payable to the holding company, the Nipissing Mines Company. Nipissing cash and cash assets totalled $805,000, as compared with $775,000 on July 1st.

Granby Consolidated has declared its regular quarterly dividend amounting to 3 per cent. on the outstanding capital shares of the company. The dividend is announced as 2 per cent. regular and 1 per cent. extra. As there are 135,000 issued shares of the par value of $100 each, this dividend, like the last six declarations of the company, amounts to $405,000. This dividend, No. 8, is payable from the New York offices on September 30th.

WANTED

POSITION WANTED

Metallurgist (experience in West Australia, India and Johannesburg, South Africa, specialist in Milling and Cyaniding and Assaying) open for engagement.

"Randt,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada.

I WILL GRUBSTAKE

PROSPECTOR and develop the find, if showing warrants. Don't waste your time writing me about ordinary opportunities; I'm deluged with such.

J. B. SPERRY, 18 BROADWAY, NEW YORK.

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

FOR SALE

Platinum in Commercial Quantity with percentage of Gold and Iridium, assays from 1 oz. 3 dwt to 1 oz. 15 dwt, test pit 5 ft. deep, value of ore increasing with depth; title in fee simple and unemcumbered; price $5000. For further particulars apply John J. Huxtable, 306 McIntyre Blk., Winnipeg

FOR SALE

Good mica claim—mica in paying quantity. Also two claims in Temagami, showing Cobalt bloom and giving good assay of silver. Excellent opportunity for investment.

For full particulars apply to

A. Valois, Box 54,
Mattawa, Ont.

FOR SALE

A valuable property of Iron Pyrites in the Township of Madoc, about 1½ miles from the Bay of Quinte Railway. Two veins 11½ feet wide and 6 feet wide respectively of high grade pyrites, averaging 52 per cent. sulphur. Mining cheap. Veins have well defined walls. Mine is on side of high hill.

For further information apply to

S. Wellington, Box 63, Madoc,
Wm. Cross, Box 150, Madoc.

Fine White Gypsum Quarry In Newfoundland For Sale

Quality A1, Quantity Inexhaustible, Favorably Situated for Export to Canada and United States, and if Calcined at Quarry can command the British and some of the Continental Markets.

☞ **This is a Most Desirable Investment and can be had at Low Price** ☜

Apply to J. H. CATHRAE, 5346 Calumet Ave., CHICAGO.

Steel Side-Walls for Modern Homes

Far surpasses wood, plaster or paper in beauty—matches perfectly any art scheme—any color scheme—makes the rooms REALLY sanitary—gives protection against fire—these are some of the reasons why YOUR house—why any modern building anywhere should have

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CAADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Canada.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

Underwood

Accurate alignment is an essential of good typewriting; not merely good alignment, but permanently good alignment.

The Underwood has a guide which compels every character to appear in exactly the right position.

The principle of this guide is fully protected by our patents. Other typewriter manufacturers have been working overtime in the endeavor to circumvent us in the matter of a guide—without success.

Without it their machines must continue to occupy their present position—of inferiority. Write for catalogues.

United Typewriter Co., Limited, Adelaide St. East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

1 000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

Announcement

THE publishers of THE CANADIAN MINING JOURNAL are presently to issue a Souvenir Handbook commemorating the recent visit of the American Institute of Mining Engineers to Ontario. This Handbook will be in every way a complete and appropriate memento of an important event. The cover has been specially designed. The text will embody a synopsis of the proceedings and expressed opinions of the eminent visitors, and historical and descriptive sketches of the mining districts visited. Many half-tones and maps will embellish the reading matter.

The Handbook will appear during September. As the edition will be limited, orders should be placed at once. The price is One Dollar.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586 008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Westinghouse Motor Quality

CAN BE DEPENDED UPON IN ANY CLASS OF SERVICE.

We illustrate a Westinghouse Motor operating an Ottumwa Box Car Loader.

This service calls for—

A motor of exceptional electrical characteristics.

A motor of extremely strong construction.

A motor simple and easy to operate.

All these qualities and others are embodied in Westinghouse Motors.

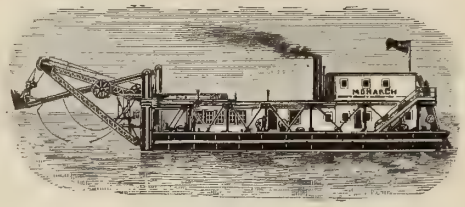
We manufacture the "AMERICAN" Centrifugal Pumps. These are built in three styles.

Single Stage Horizontal or Vertical up to and including total lifts of 65 ft.

Single Stage High Pressure horizontal for lifts up to and including 125 ft.

Two Stage High Pressure horizontal for total lifts up to and including 250 ft.

We guarantee at least 25% mechanical efficiency over any other pump of equal size or make, or we can furnish 25% more water with same size of pumps and power than can be procured with any other make of centrifugal pump.



Give us your specifications and we will make you our best prices.

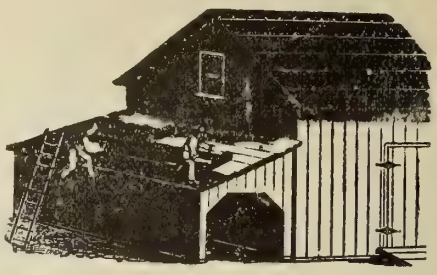
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

Leading Features of a Good Rock Drill

No. 3.—Patented Adjustable Shell

The Patented Adjustable Shell of the "RAND" Drill is a valuable feature, and is the only practical adjustable shell on the market. By removing one or more of the thin sheet-iron shims and tightening the slide bolts again both top and side wear is taken up. The shims are held by dowels, so that they cannot wear out. On the smaller drills the shells are made of malleable iron, but on the large drills where the shells are subject to greater strains they are made of the highest grade of open-hearth steel castings.

This arrangement of guides assures the maximum of bearing surface whatever the position of the drill. Adjustment is secured by taking-out liners, therefore no extra stock is needed.

McGill University

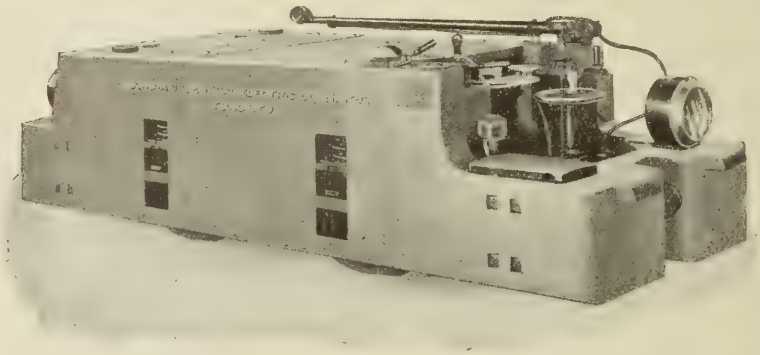
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

SOPHISTRY.

The *Toronto Evening Telegram*, in a recent editorial, contends that, so long as newspapers reserve the right of criticism, they can fairly and honestly sell space to legally constituted mining companies.

Preliminarily we may remark that the *Telegram* has kept its columns clean—cleaner considerably from the taint of dishonest mining advertisements than, for instance, has the *Globe* or the *World*. Its argument, therefore, we may respect, even though we fail to agree with it.

Our reasons for differing from the *Telegram* may be brought out by an instance from real life. The *Globe* of October 2nd publishes an advertisement of a mining stock. The character of this advertisement is fully explained in this issue of THE CANADIAN MINING JOURNAL. Briefly, it is dishonest and illegal. It occupies slightly more than one-half page in the *Globe*.

The *Globe* of Monday, October 7th, points an accusing finger at a contemporary for publishing racing tips of a nature calculated to part a callow youth from his money.

Now the *Telegram* will admit that unless care is exercised in the publication of mining advertisements, more harm and more loss can easily result to a greater number of all sorts and conditions of people than could be possible in the case of a race track tip. The latter appeals to a limited class. The former are so coated and glazed that they appeal to the whole reading public.

We fail to see that the *Telegram* can justify by means of logic a contention that its own honesty has not permitted it to put into practice.

Our country has suffered far too much hurt from wildcats. THE CANADIAN MINING JOURNAL believes that they will be exterminated only by a plain statement of the truth. It is too late in the day to indulge in vague moralizing. It is also too late to allow the observance of the pleasant little courtesies and anonymities of journalism to interfere with a clear understanding of the situation.

COAL CUTTING MACHINERY.

Established customs and usages die hard. Great Britain has become, quite unjustly, proverbial for the reluctance with which innovations are accepted. In the United States the pendulum swings to the other extreme. New machinery, for instance, is not infrequently installed in place of old, merely because it is new. Canada is not free from either of these extremes. Mining companies very often make lavish purchases of untried ma-

chinery that finds its way to the scrap pile before it has seen any substantial service. On the other hand, we have an example of groundless prejudice in the case of the Cape Breton coal miners, who are petitioning the Local Government to prohibit the use of disc-and-chain coal cutters in pillar work in Nova Scotian collieries. Our Nova Scotian correspondent describes the condition of affairs accurately in his current letter. "One had thought, however, that this time-worn objection to the mechanical coal cutter had been relegated to oblivion along with the objections made to the spinning mule and the steam locomotive."

It is evident that the miners' society, the Provincial Workmen's Association, has not given the question deep thought. It is an easy matter to create and foster a groundless prejudice against new machinery, more especially when that machinery revolutionizes mining methods. But, ultimately, the effect of such an agitation will be harmful alike to mine and miners. Mechanical coal cutters are not merely time-saving devices. In experienced hands they increase the earning capacity of the miner and the output of the mine. They are an essential of modern practice. The miners of Cape Breton are physically and intellectually the equals if not the superiors of any other stratum of society. They have the means through their organization of studying the record of coal cutting machinery in other countries. It will be a sad blow to the prestige of the P. W. A. if it is directly or indirectly responsible for preventing the use of modern and efficient mining machinery.

CANADA AND THE JAMESTOWN EXPOSITION

The management of the Jamestown Exposition has set aside October 24th as "Nova Scotia Day." On that day it is hoped that the Governor-General of Canada, the Lieutenant-Governor and Premier of Nova Scotia and other distinguished officials will attend the Exposition.

The following day will be celebrated as "Canada Day."

A gratifying consideration is the fact that Nova Scotia's exhibit of gold ores is the most complete to be seen at the Exposition.

NORTH HASTINGS.

Without noise or bluster a revival of mining has taken place in North Hastings. At Deloro, the new plant of the Deloro Mining & Reduction Company is providing a means for the opening up of the rich arsenical pyrites deposits of that section. Near Madoc the old Henderson talc mine is producing granular talc of most exceptional purity. Iron pyrite deposits are being worked in the surrounding district. It is probable also that the old Belmont gold mine will take a new lease of life. Farther north the mines of the Mineral Range Iron Mining Company at Bessemer are producing steadily a high grade low phosphorus magnetite. In gold, copper, iron, arsenic, talc and fluorspar, not to mention excellent marble and other building stones, North Hastings has the sound basis of a large and varied mineral industry.

A WARNING

As noted elsewhere, Law & Company, the promoters of "Highland Mary" and other Larder Lake companies, have been advised by the Attorney-General's Department to withdraw their advertisement of that affair from the Toronto dailies. This fact should be given wide publicity. We urgently request every reader of THE CANADIAN MINING JOURNAL to aid us in preventing the flotation of such companies. The principal sufferers in all such wild schemes are people with small savings bank accounts, who readily believe the plausible untruths served out to them in the shape of advertisements. We have received full particulars of several instances where farmers and school teachers have been induced to put all their savings into one of these wild cats. These things we intend to search out.

With the intelligent help of our readers we know that it will be possible to prevent the publication of dishonest mining "literature" all over Canada. Just now Law & Company are advertising "Highland Mary" in Quebec and Nova Scotia.

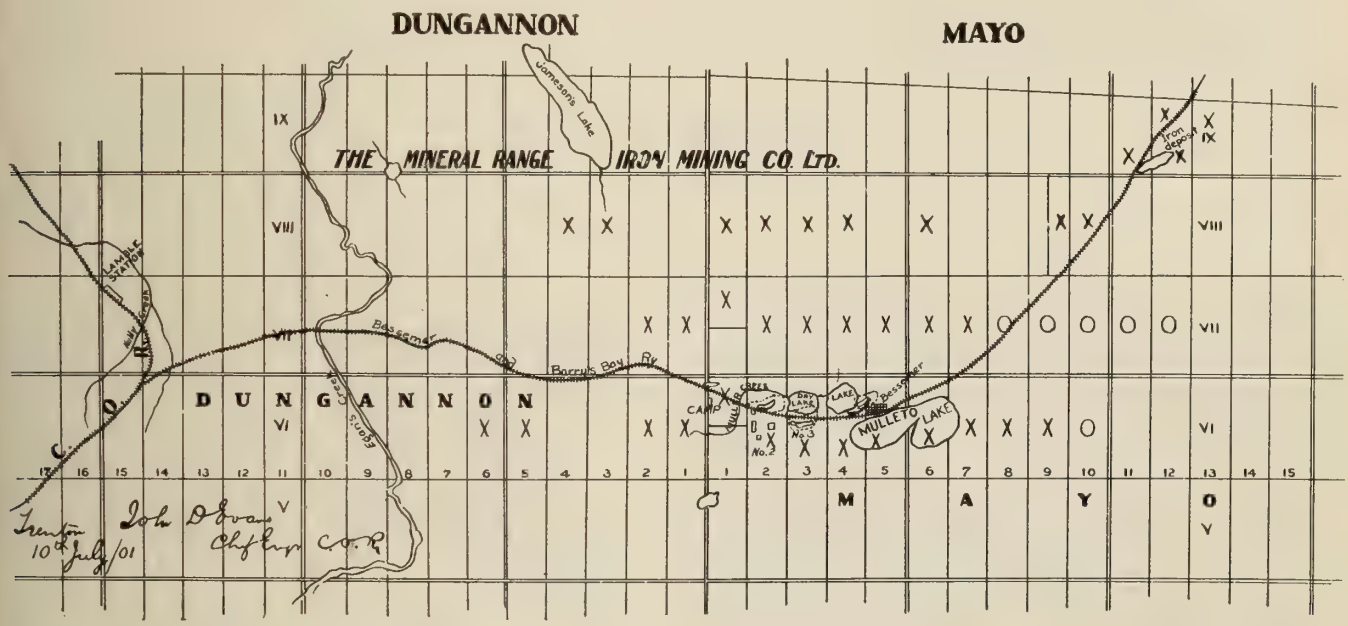
There is no crime meaner, none more sordid, none quite so deserving of contempt, as the deliberate attempt of brokers to misrepresent what they have to sell in such a way that poor and unsophisticated people will give up their savings in the hope of getting rich by a short cut. Advertisements of such things as "Highland Mary" are tossed aside, laughed at, by men who know anything about what mining means.

Editorial Notes.

In our issue of October 1st suitable acknowledgment was omitted of the fact that the paper on "Coal Briquetting" was read at the Toronto meeting of the American Institute of Mining Engineers. We wish to express our regret that this oversight occurred.

The United States postal authorities are making war upon fraudulent mining stock companies. It is being pointed out by the American press that the present force of inspectors is inadequate. Evidence sufficient for the conviction of offenders is so hard to get that often the promoters have amassed a fortune before they can be caught and have escaped to more salubrious climates.

Messrs. Law & Company, the promoters of "Highland Mary" were notified on October 4th that the advertisement appearing over their name was in contravention of the Ontario Compannies' Act and that it must be withdrawn from the papers. The Attorney-General's Department acted promptly in this matter. For this the Department deserves warm praise.



The Magnetite Mines of the Mineral Range Iron Mining Company, Limited, at Bessemer, Hastings County, Ontario.

The pluck and clean fighting qualities of one man have been the chief factors in the exploitation and development of what is undoubtedly one of the most promising magnetite deposits in Canada.

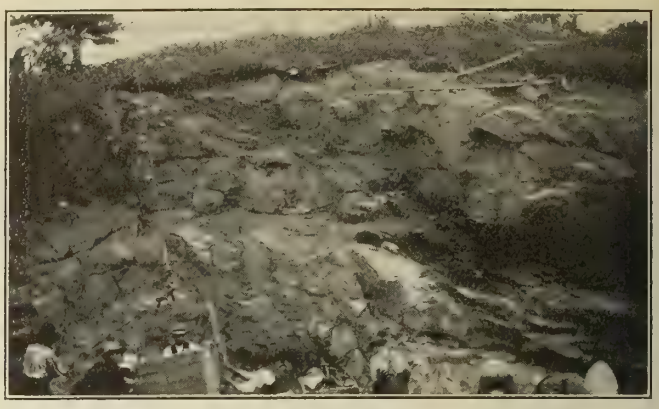
Near L'Amable Station on the Central Ontario Railway, the spur line of the Mineral Range Iron Mining Company's provides means of transportation for the ore from the Bessemer mines. To Mr. H. C. Farnum, who is the discoverer of the deposits, the organizer of the company and the general manager of the mines and railway, belongs the credit of beginning the enterprise and of steering it through many shoals.

The mines are situated about five miles northeast of L'Amable Station. The company controls 700 acres of developed mineral claims from which ore has been shipped and sold, and 3,000 acres of undeveloped claims.

The ore bodies lie mainly in diorite, although at No. 2 mine there is an intrusion of granite. The ore itself is a high grade granular magnetite, containing phosphorus well below the bessemer limit, very little sulphur and not a trace of titanium. A very pure magnetite compact massive and displaying a string vitrous lustre is also found, principally at No. 2 mine. With the ore is associated a fluctuating percentage of calcite. Iron pyrites also occurs, but in such a manner as not to affect the value of the ore. This is explained by the fact that this objectionable mineral is not disseminated through the ore, but is found as the filling matter of small stringers, in distinct and easily separable masses along the contact of the ore and the wall rocks, and sometimes on the contact faces of the ore and included masses of rock. In mining, crushing and loading the ore sufficient culling is done to bring the sulphur down to a negligible amount.

MAP OF PROPERTY OF M.R.I.M. CO., LTD.—LOTS MARKED X AND O.

The ore bodies have a dip of 60 degrees south and a general northeast and southwest strike. The extent of these bodies it is impossible to estimate accurately. More than 6,000,000 tons of ore is in sight. But there is strong evidence that the range is continuous over the two and one-half miles intervening between Nos. 3 and 4 mines and Child's mine to the northeast. It is neither safe nor



Office and Shop at Bessemer.

View from Lake.

Boiler House at No. 4 Mine in Course of Construction.

Open Cut at Bessemer.

wise to attempt to compute the possible tonnage of this vast body. But even if belief in the continuity of the mass of magnetite is not substantiated by events, still the deposit is a large one.

At No. 3 mine the ore body is 300 feet wide and has been opened for 850 feet. The foot wall at this width is not yet in evidence. A diamond drill core has been taken to the depth of 160 feet. At this depth the ore shows

Open Cut at Bessemer.

Boiler House.

no change. The opening in No. 4 is longer and narrower —1,100 feet by 220 feet. From both mines shipments have been made continuously this summer to the Canada Iron Furnace Company at Midland, Ont., to the "Soo" furnaces and to the Deseronto furnace. Usually these shipments average more than 55 per cent. metallic iron, from 0.01 to 0.07 per cent. sulphur, and from a trace to 0.03 per cent. phosphorus. But shipments of over 100 tons have been made in which the metallic iron averaged more than 63 per cent.

At No. 2 mine, at Child's mine, two and a half miles northeast, and at several intermediate points, development work has been done, more with a view to proving the properties than for shipment purposes, although several shipments have been made.

Near No. 4 mine a substantial power plant has been erected. Here also a shaft house and head frame have been built, in which is installed a large gyratory crusher, capable of crushing 1,000 tons of ore per shift. Both No. 4 and No. 3 mines are worked as open pits; but at No. 4 pit a shaft is being sunk to the dip. The ore from the No. 4 pit trams is dumped into a two ton skip. The ore from No. 3 is dumped into bins, and thence into the skip. The skip is hoisted on a trackway at an incline of about

Skip-way, Crusher and Power House

No. 4 Mine.

60 degrees, and is dumped directly into the capacious crusher. At present only one skip is in service, but a double skipway is laid and as soon as the shaft has been sunk to a suitable depth two skips will be run. The shaft will greatly increase the present output of the mines, which is about 300 tons per day.

Work is continued night and day at Bessemer. Light is supplied during the night shift at the shaft house by powerful gasoline gas lamps.

Large quantities of low grade ore are encountered at No. 4 mine and north to Child's mine. The iron content of these bodies varies between 30 per cent. and 50 per cent., the greater portion of it carrying between 45 per cent. and 50 per cent. To render this marketable it is proposed to erect a concentrator. This will also take care of the waste ore culled from high grade shipments. The basic idea of this is not an expensive and elaborate treatment of the ore; but a rought commercial sizing and magnetic cobbing.

Before passing to another phase of this enterprise it may be mentioned that the writer was shown a curious segregation of apatite crystals on the wall of a fissure near No. 3 mine.

Extending across four lots of the Mineral Range Iron Mining Company's territory is a fine ledge of white, pink and green marble. Negotiations are now pending for the sale of the mining rights of this marble. The writer was shown a beautiful specimen of the polished stone.

In addition to their mining areas, the company owns 10,000 acres of timber lands, a large portion of which is well timbered with cedar, basswood, spruce, tamarack, hemlock, birch, elm, ash and oak. A large saw mill is kept busy with the season's cut.

A small laboratory is now in working order. A shop, offices and many dwellings have been built. The spur line to the Central Ontario Railway is being carefully ballasted and a roadway has been surveyed and partially graded as far as Child's mine.

The Mineral Range Iron Company, Limited, was organized in 1902 by Mr. H. C. Farnum, who is the treasurer and general manager. Mr. E. V. Voigt, of Detroit, is president, and Mr. H. L. Bingham is secretary. The capital of the company is $500,000, divided into shares of $1 each. One hundred and fifty thousand shares are held by the public. The writer wishes to thank the officials of the company for much kindness shown him when he recently visited Bessemer.

Saw Mill at Bessemer.

WILD CATS AND THE PUBLIC PRESS.

CHAPTER I.

A Protest.

The Toronto daily papers, with the notable exception of the *Evening Telegram*, are still publishing the misleading and unlawful advertisements of mining promoters. In our last issue we deal with an advertisement carried by the *Toronto World*. We shall now animadvert upon a similar and even more offensive paid advertisement appearing in the *Toronto Globe* of Wednesday, October 2nd, 1907. On page 2 of that number Law & Company occupy more than half a page with an advertisement of "Highland Mary."

Of the merits of "Highland Mary" as a mining property we shall have more to say in a latter issue. This much may be postulated, however. There is no proved property in Larder Lake. The district may have success, may enjoy prosperity, when the fakirs and leeches are removed from its boundaries. But such things as "Highland Mary," unproved, undeveloped areas, staked for the sole purpose of getting into the pockets of the uninformed masses, are the most effective drawbacks to development.

The points claiming our immediate attention are the advertisement itself and the responsibility of the *Globe* and of Law & Company respectively for the appearance of such an agglomeration of extravagant and flamboyant fiction.

A few excerpts from the advertisements will give the reader an idea of the nature of Law & Company's announcement. A heavily featured proclamation that 250,000 shares were disposed of during the first eight days of sale and that applications are increasing daily is succeeded by some clap-trap advising the public not to gamble. The same public is then enjoined to purchase "Highland Mary" at 10 cents per share. This they can do with the certainty that, on the honor of Law & Company, Limited, they will receive "an income that will each year exceed the total amount of the investment." Among other sad features of this promotion, the above implies that already Law & Company have sold at least 250,000 shares of "Highland Mary" at 10 cents per share, totalling $25,000. "Highland Mary" is an undeveloped prospect. Law & Company's acquaintance with legitimate mining is at once discounted by their willingness to make such promises as that quoted above. With the assistance of the daily press they are, however, pushing "Highland Mary" upon the market. They are trying to convince the unfortunately credulous public that "Highland Mary" will "make stockholders rich." As usual, they predict a "big advance" in the price of shares. Surely Law & Company, boasting "seventeen years of unfailing business integrity," could afford to dispense with this last hall-mark of unsanitary stock promotion.

It is now in order to look at the "Highland Mary" advertisement of Law & Company in the light of the

Ontario Companies' Act. Section 94 of this Act defines the word "prospectus" as meaning "any prospectus, notice, circular, *advertisement* or other invitation offering for subscription or purchase any shares, debentures or other securities of a company, or published or issued for the purpose of being used to promote or aid in the subscription or purchase of such shares, debentures or securities, and the word 'company' shall mean *any company incorporated or proposed to be incorporated.*"

Section 99 outlines what is to be disclosed in any prospectus. The only exception made in the case of an advertisement is that the names of the original incorporators and the number of shares subscribed for by them need not be specified. Otherwise an advertisement is regarded as a prospectus and the same penalties are provided to punish irregularities.

We find then that the advertisement of Law & Company in the *Toronto Globe* of Wednesday, October 2nd, 1907, makes no mention of the consideration for purchase. This is distinctly required by the Act.

Neither the amount of preliminary expenses, nor the promoters' remuneration, nor the particulars as to material contracts, nor the names of the company's auditors are to be found. The publication of this advertisement is therefore a reckless breach of the law of the land. But it is more and worse than this.

Like "Big Ben" of fragrant memory, the promoters of "Highland Mary," while they mention that they hold 1,000,000 treasurery shares for development purposes (as against 2,000,000 shares obviously not for development) do not specify which variety they are selling. The assumption therefore is that they are not selling treasury stock, and "Highland Mary" may well be described as a sure source of income to Law & Company, Limited, the worthy promoters of that Celtic damsel.

But, to be brief, many things that investors have a right to know and must of necessity know before they can intelligently buy a cent's worth of mining stock are entirely absent from Law & Company's public announcement. Therefore we urge the itching speculator to get a copy of the Ontario Companies' Act. Let him therefrom learn in what respects Law & Company disregard and evade that Act. Then let him respectfully but firmly insist that Law & Company give him all the particulars of every transaction and agreement incidental to the promotion of "Highland Mary"—particulars which in all decency should be fully revealed to the public before a share is sold.

Finally let the possible purchaser remember that a prospect, an undeveloped claim, in Larder Lake is no more than a mere speculative venture in a district of which far too much has been said and of which far too little is known. Law & Company's assurance about the richness of the camp, their quotations of assay results, are so worthless that they need not enter into the discussion.

Referring to the *Globe*, in which this advertisement appeared, we wish to express our unqualified disapproval of the manner in which that newspaper sells its moral support to such wild ventures as that instanced above. Lately the Province of Ontario welcomed a group of British journalists. These men, writers and publicists of a high class, spoke in no uncertain tones of the almost irreparable injury done to Northern Ontario by the unsavory mining schemes which have been and are being floated in the Motherland. They most impressively advised the press and the people of Ontario to discourage such iniquitous phases of frenzied finance.

The *Globe*, admittedly one of the foremost journals of Canada, owes a duty to the public from whom it receives its support. It cannot publish unlawful and misleading advertisements for a money consideration and hope to escape the consequent stigma. In seeming and in truth the paper that continues to publish fraudulent advertising matter makes itself a friend and ally of wild cats. Let us remind the *Globe* that a lofty moral tone and dishonest advertisements, like oil and water, are not miscible. The *Globe* must either adjust the moral plane of its editorials to the level of Law & Company, or exclude all such vicious advertisements from its columns.

CHAPTER II.

An Illustration.

It was in the early spring of this year that Arthur G. Penman, managing director of Penman & Spraug, Limited, Toronto, organized a syndicate to purchase frome Rinaldo McConnell, of Ottawa, a mining property situated on the south half of the southeast quarter of the north half of lot No. 5, concession 4, District of Nipissing, Province of Ontario. The members of the syndicate were chosen with a good deal of discrimination. Many of them were men prominent in political and commercial life. After an option had been secured and a company organized mining rights on the property specified above were purchased for about $50,000.

The name chosen for the company was "The Cobalt Silver Mountain Mining Company."

Mr. Penman appears to have exercised much more sagacity in the selection of his directors and officers than in the choice of his mining location. True, the latter is a very secondary consideration to the average advertising promoter. But we fear that Mr. Penman might well have investigated his property and his title with slightly greater caution.

Mr. Penman, realizing to the full the necessity of having an attractive lot of officers and directors, induced a very prominent politician to act as president of the new company. Fate intervened and carried off this president to another sphere of activity. With no loss of time Mr. Penman then fixed upon E. Guss Porter, Esq., of Belleville, Ont., member of the Dominion Parliament for West Hastings.

Apparently Mr. Penman's imagination and his sense of social discrimination were the only faculties brought into play in these preliminaries. Neither common sense, business acumen nor everyday honesty was evident in the handling and flotation of the company.

The syndicate was formed, the company was organized and shares were sold on the understanding that about nineteen acres of favorably situated mining lands were to be the property of the company. It presently developed, however, that only eleven acres could be patented. Suit was entered by the company against McConnell for the recovery of part of the purchase price. The suit is still dragging on. Money, sorely needed to explore the eleven acres has been, perforce, applied to legal expenses. The position of the company financially is practically hopeless.

Superficially this might appear to call for sympathy. Actually it is an example of a typical mining swindle dying a natural death. A plausible and unscrupulous youth, who certainly knew what he was doing, and whose only aim was to sell the public a doubtful mining claim at an unreasonable figure, induced a number of citizens to help him form a syndicate. The prospectus filed is

fraudulent, and the whole method of flotation was designed to enrich Mr. Penman and his associates. The latter may have been victims of Mr. Penman's wiles; but in effect and in law they are his confederates.

The net results of the prom tion of the Cobalt Silver Mountain Mining Company are that the syndicate is out the purchase price of the areas, and that the property has never, and probably never will under the present regime, ship a car load of ore. It has on its hands a costly law suit, eleven acres of mining claims and a reputation that needs disinfecting.

And now we may point our moral. The *Sunday World* early last spring printed a portrait of A. G. Penman, to whom it referred in terms of warm appreciation. Photographs of a trench on the Cobalt Silver Mountain Company's property also appeared and the whole scheme was given a large amount of prominence.

Despite the *World* and Mr. Penman, notwithstanding puffs and prospectuses, the company has failed dismally to do anything more than enrich one or two personal bank accounts at the expense of a number of others.

Thus the reader of the *Toronto World* or of any other newspaper, when he glances over the fat assurances of Messrs. Law & Company regarding "Highland Mary," may well reflect upon the sad fate of the Cobalt Silver Mountain Mining Company, Limited, of which Mr. Arthur G. Penman is managing director and Mr. E. Guss Porter, M.P., president. Cobalt Silver Mountain started life with all the accessories of such schemes—newspaper puffs, dazzling promises and doubtful methods. A bitter legacy of trouble is the principal result of nearly a year of existence. "Highland Hary" begins lifs with even more glowing promises. The smash, when it comes, will be proportionately greater. Can a respectable newspaper like the *Globe* afford to identify itself with this sort of thing?

We must not close this article until we have referred to an engineer's report, which is incorporated in the prospectus of the Silver Mountain Mining Company. The report is signed by E. C. Kinswell, M.E., and is a most discreditable performance. We hope for Mr. Kingswell's sake that the letters "M.E." are not rightfully his. But if Mr. Kingswell is a graduate of a technical college and can claim the right to his title, he was then deliberately sinning against light and knowledge in concocting such a mass of mischievous nonsense.

THE NOMENCLATURE OF IRON AND STEEL.*

In 1901 the International Association for Testing Materials appointed an influential committee to establish uniform nomenclature for iron and steel. The committee comprised Professor H. M. Howe (New York), chairman; Mr. L. Lévy (Paris), and Professor D. Tschernoff (St. Petersburg), vice-chairman; Professor A. Sauveur (Harvard), secretary, and seventeen members, including Messrs. E. P. Martin, A. Pourcel, H. Wedding, and H. H. Campbell. The report was presented by Professors H. M. Howe and A. Sauveur at the Brussels Congress of the International Association, and it was proposed that the report be submitted to the Iron and Steel Institute for consideration. The Council would, therefore, be pleased to receive written comments for publication in the Journal.

*Paper read before the Iron and Steel Institute.

The report gave the following definitions:—

Alloy Cast Irons.—Those which owe their properties chiefly to the presence of an element (or elements) other than carbon.

Alloy Steels.—Those which owe their properties chiefly to the presence of an element (or elements) other than carbon.

Basic Pig Iron.—In America, pig iron containing so little silicon and sulphur that it is suited for easy con version into steel by the basic open-hearth process. It is restricted to pig iron containing not more than 1.00 per cent. of silicon.

Bessemer Pig Iron.—That which contains so little phosphorus and sulphur that it can be used by itself for conversion into steel by the original or acid Bessemer process. In America, this term is restricted to pig iron containing not more than 0.10 per cent. of phosphorus.

Bessemer Steel.—Steel made by the Bessemer process, whether its carbon content is high, low, or intermediate.

Blister Steel.—Steel made by carburising wrought iron by heating it in contact carbonaceous matter. It might also be made by so carburising a low-carbon steel.

Cast Iron.—Generically, iron containing so much carbon, or its equivalent, that it is not malleable at any temperature. Specifically, cast iron in the form of castings, other than pigs, or remelted cast iron suitable for casting into such castings, as distinguished from pig iron, *i.e.*, cast iron in pigs, etc. (See Pig Iron.) The committee recommends drawing the line between cast iron and steel at 2.20 per cent. carbon, for the reason that this appears from the results of Carpenter and Keeling to be the critical percentage of carbon corresponding to the point "a" in the diagrams of Roberts-Austen and Roozeboom. As to the significance of this critical point, the committee is not prepared to express an opinion.

Cast Steel.—The same as crucible steel; obsolescent, and to be avoided because confusing, and because it offers a temptation to fraud.

Cemented Steel.—The same as blister steel.

Charcoal Hearth Cast Iron.—Cast iron which has had its silicon and usually its phosphorus removed in the charcoal hearth, but still contains so much carbon as to be distinctly cast iron.

Converted Steel.—The same as blister steel.

Crucible Steel.—Steel made by the crucible process, whether its carbon content is high, low, or intermediate.

Grey Pig Iron and Grey Cast Iron.—Pig iron and cast iron in the fracture of which the iron itself is nearly, or quite, concealed by graphite, so that the fracture has the grey color of graphite.

Haematite Pig Iron.—Originally pig iron made from the haematite ores of England, which happen to be so free from phosphorus and sulphur that the pig iron made from them can be used by itself for the acid-Bessemer process. By association, it has come to mean any pig iron thus relatively free from phosphorus and sulphur. The term is not used in America, and is undesirable.

Hot Metal or Direct Metal.—The molten cast iron from the blast furnace before it has been allowed to solidify.

Ingot Iron.—Steel cast into an initially malleable mass and containing so little carbon or its equivalent that it does not harden greatly on sudden cooling. The word is rarely used in England, "mild steel" or "low-carbon steel" or "soft steel" being generally used in its place. In America, the line between soft steel and half-hard steel is usually drawn at a carbon content of about 0.20 per cent.

Ingot Steel.—Steel cast into an initially malleable mass and containing so much carbon or its equivalent that it hardens greatly on sudden cooling. The word is rarely used in England, but "hard steel," "high-carbon steel," or "half-hard steel" are used in its place.

Malleable Castings.—Castings of malleable iron, which see.

Malleable Cast Iron.—Iron which, when first made, is cast in the condition of cast iron, and is made malleable by subsequent treatment without fusion. Although the English name of this variety suggests that it is cast iron, it is not truly a variety of cast iron, but rather forms an independent species of iron, because it lacks the essential property of cast iron, viz., its extreme brittleness. Though the term "malleable castings" is very common, the term "malleable cast iron" is very rarely used. The common but inexcusable term, we regret to say, is "malleable," pronounced "mallable," used as a substantive.

Malleable Iron.—The same as wrought iron. Used in Great Britain, but not in the United States, except carelessly, as meaning "malleable cast iron."

Malleable Pig Iron.—An American trade name for the pig iron suitable for converting into malleable castings through the process of melting, treating when molten, casting in a brittle state, and then making malleable without remelting. The term should be used with care to avoid confusion. This material is so called in trade in America "malleable iron"; but this use should be avoided, because "malleable iron" has the older and (in Great Britain) firmly established meaning of "wrought iron."

Mottled Pig Iron and Mottled Cast Iron.—Pig iron and cast iron, the structure of which is mottled, with white parts in which no graphite is seen, and grey parts in which graphite is seen.

Open-hearth Steel.—Steel made by the open-hearth process, whether its carbon content is high, low, or intermediate.

Pig Iron.— Cast iron which has been cast into pigs direct from the blast furnace. This name is also applied to molten cast iron which is about to be so cast into pigs, or is in a condition in which it could be readily cast into pigs.

Plate Iron.—A name applied in Great Britain to refined cast iron.

Puddled Iron.—Wrought iron made by the puddling process.

Puddled Steel.—Steel made by the puddling process, and necessarily slag-bearing. (See Weld Steel.)

Refined Cast Iron.—Cast iron which has had most of its silicon removed in the refinery furnace, but still contains so much carbon as to be distinctly cast iron.

Shear Steel.—Steel, usually in the form of bars, made from blister steel by shearing it into short lengths, piling, and welding these by rolling or hammering them at a welding heat. If this process of shearing, piling, &c., is repeated, the product is called "double shear steel."

Steel.—Iron which is malleable at least in some one range of temperature, and in addition is either (a) cast into an initially malleable mass; or (b) is capable ob hardening greatly by sudden cooling; or (c) is both so cast and so capable of hardening. Variety *a* includes also molten iron, which, if cast, would be malleable, as do its two sub-varieties, "ingot-iron" and "ingot-steel." (Tungsten steel is malleable only when red hot.)

Steel-Cast (adjective).—Consisting of solid Bessemer, open-hearth, crucible, or other slagless steel, and neither forged nor rolled; applied to steel castins. For instance, a "steel-cast" gun is a gun which is a steel casting, *i.e.* which has been neither forged nor rolled. To call it a "cast-steel" gun would imply that it was made of crucible steel, to which the term "cast-steel" is restricted.

Steel Castings.—Unforged and unrolled castings made of Bessemer, open-hearth, crucible, or any ther steel. Ingots and pigs are, in a sense, castings; the term "steel-castings" is used in a more restricted sense, excluding ingots and pigs, and including only specially shaped castings, such as are generally used without forging or rolling. They may, however, later be forged, *e.g.* under the drop press, when they cease to be "castings" and become "drop-forgings," or, if only part is forged, then they are partly forgings and partly castings.

Washed Metal.—Cast iron from which most of the silicon and phosphorus have been removed by the Bell-Krupp process without removing much of the carbon, so that it still contains enough carbon to be classed as cast iron. The name "washed metal" is extended to cover this product even if its carbon is somewhat below the proper limit for cast iron.

Weld Iron.—The same as wrought iron. Obsolescent and needless.

Weld Steel.—Iron containing sufficient carbon to be capable of hardening greatly by sudden cooling, and in addition slag-bearing, because made by welding together pasty particles of metal in a bath of slag, as in puddling, and not later freed from that slag by melting. The term is rarely used.

White Pig Iron and Wuite Cast Iron.—Pig iron and cast iron in the fracture of which little or no graphite is visible, so that their fracture is silvery and white.

Wrought Iron.—Slag-bearing, malleable iron, which does not harden materially when suddenly cooled.

Wrought Steel.—The same as weld steel. Rarely used.

The following are definitions of names designating special sizes or shapes of iron and steel:—

Bar Iron.—Wrought iron in the form of bars, rods, &c.

Muck Bar.—The rough bars, usually 1 inch thick and about 4 inches wide, made by the first rolling of a ball of puddled iron.

Merchant Bar.—Wrought iron in the form of merchantable bars or rods made by shearing muck bar into short lengths, piling it and rolling or forging it at a welding heat.

Bloom.—1. A large bar, drawn from an ingot or similar mass, for further manufacture. 2. A rough bar of wrought iron drawn form a Catalan or bloomery ball for further manufacture.

Billet.—A small bar drawn from a pile, bloom, or ingot for further manufacture. The committee recommends that the line between blooms and billets be drawn at the size of 5 inches square, as representing common custom.

Slab.—A flat piece or plate, with its largest surfaces plane, or sheared from an ingot or like mass for further treatment.

In conclusion, the view is expressed that it would be well to decide on a definite carbon content to serve as a boundary line between ingot ironand ingot steel, between puddled iron and puddled steel, and between any other varieties of wrought iron and weld steel. Two plans have been considered. One is to draw this line at 0.32 per cent. carbon or its equivalent in other elements, for the reason that this carbon content appears to correspond to the critical point O in the diagrams of Roberts-Austen

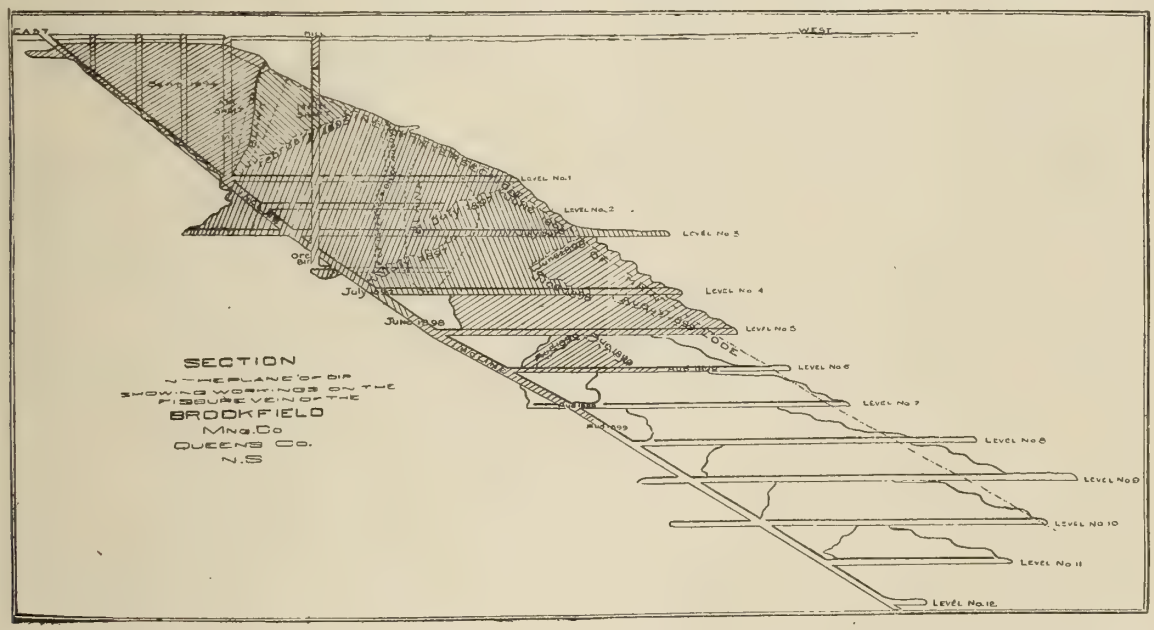
and Roozeboom. This has the merit of corresponding to a definite physical boundary. The other plan is to draw the boundary at 0.20 per cent. of carbon, because this is a convenient place to separate the important classes "soft steel" and "half-hard steel," so that if this point was adopted "ingot iron" would be synonymous with "soft steel," and "ingot steel" would be equivalent of the two classes "half-hard steel" and "hard steel."

The report was received and adopted by the Congress, and the committee was requested to continue their labors with a view to securing the foreign equivalents to the terms defined.

THE DEVELOPMENT OF AN ORE SHOOT IN NOVA SCOTIA.[1]

By E. Percy Brown, B.Sc., Goldboro, N.S.

(Read 28th March, 1907.)



Looking over the history of mining in Nova Scotia, one is struck by the large number of properties which, though proved phenomenally rich on the surface, have been abandoned after a rocket-like career of one or two years. The depth usually reached has not been great, two hundred to three hundred feet being the average. In many cases it has been less, in a few cases more, and two reached the depth of one thousand feet.

In almost all instances where any really successful mining has been done in Nova Scotia, a "shoot" or chimney of rich ore has been successfully followed and the poorer portions of the vein neglected. And it is well to note that Nova Scotia is not exceptional in this respect. If the reader will consider, he will find that the majority of the richest gold mines in the world have been of this class. The large, uniform, low-grade propositions are the exception rather than the rule.

The objects of this paper are three-fold: (1) To give in brief outline the history of a certain gold mine in Nova Scotia, showing the similarity of the early history of this mine to the total brief history of many of the richest gold deposits of this Province; (2) to show how, by a happy combination of knowledge, pluck and perseverence, the history of this mine was prolonged; and (3) to indicate the probability that many of the other rich outcrops could be opened up and followed in a similar way.

The property of the Brookfield Mining Company[2] was first opened in 1886. The returns of the mines office for 1887 show that 1,418 ounces of gold were produced from 1,691 tons of quartz. An extreme depth of about 250 feet was reached and the system of mining is shown in the upper left-hand portion of the accompanying sketch. Four shafts were sunk in a distance of about 200 feet and the ore mined out between them by underhand stopping.

This method is recognized by anyone familiar with mining practice in Nova Scotia as the method almost universal in this Province until a few years ago, and it is important to note in this connection how peculiarly well adapted to closing down a mine is such a system.

No development work, such as levels and shafts, was carried ahead, and if a blank or poor portion of the ore-body occurred, particularly if it occurred as in the case under consideration, all the stopes would likely be in it at the same time, seeming to justify the belief of the superficial observer that the vein had absolutely "petered out."

The four shafts were sunk while they were in pay ore and the line of stopes carried ahead until they had reached the position shown in the sketch. Another shaft was sunk about 120 feet further west, but not reaching

[1]Paper read before the Nova Scotia Mining Society.
[2]At Brookfield, Queen's County, N.S.

ore at a depth of about 60 feet, it too was discontinued. Thus no ore was visible in any of the shafts or on the stopes, and the mine was abandoned.

The plan of the Brookfield mine at this time might stand almost unaltered for the underground plans of dozens of abandoned mines in Nova Scotia to-day. Many of these have given high returns for a year or two; many shafts have been sun, the rich ore and handsome specimens being dug out between them; managers, assistant managers, superintendents, etc., have enjoyed good salaries; many miners have made small fortunes by stealing rich nuggets; until the day has come, as in the above case, when all the shafts were bottomed in barren ground, the stopes were black and the mine was closed down, leaving an indignant body of stockholders to mourn their loss and blame the gold measures of Nova Scotia.

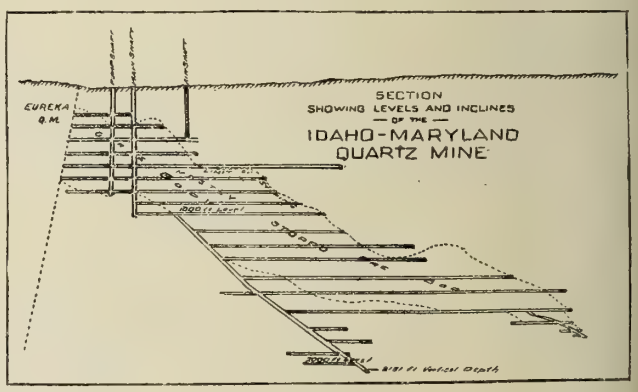
In September, 1894, this mine was pumped out by Mr. W. L. Libbey, who had for underground foreman Mr. C. N. Crowe. Mr. Crowe had had experience outside of Nova Scotia and appreciated the fact that an ore body as rich as this had proved was not likely to be an isolated bunch. He had seen pay shoots found and followed in other countries, and "hulk seams," even when no thicker than a knife blade, chased through blanks to rich bodies of ore. Such a hulk seam existed here, and certain corrugations on the vein walls, together with the dip of angulars, etc., indicated the direction to take.

A main or interstratified vein, intersecting the Libbey "fissure" in strike and dip, appeared to cut off the latter vein and to form the upper limit of the pay shoot. The stopes in the eastern end of the mine were found to be practically on the lower limit of the ore. A drift was started westwardly from about the point A. Within a month rich quartz was encountered and in less than three months the mine was on a handsomely paying basis, yielding larger returns than it had in its early days. The blank portion of the vein in the western end of the mine was proved to be small and the stopes were pushed ahead through it. The sketch shows the condition of the mine in February, 1895.

The limit of the pay shoot, having thus been established, it becames necessary to outline a plan for its economical development. An incline was run along the lower edge of the pay shoot, levels driven at intervals across the ore body, and the ore stoped out between them. The outline marked July, 1895, shows this system.

The wisdom of Mr. Libbey's plan of development has been frequently questioned. It seems to me, however, that, where a rich chimney of ore has been proved to exist in a narrow, irregular vein, the secret of successful mining lies in getting in touch with the ore and staying with it wherever it may lead.

There are many examples in Nova Scotia where the other plan, viz., sinking vertical shafts, has been tried and proved a failure. Certainly Mr. Libbey's system was well tested during the year 1897, when a blank portion of the vein was again encountered, and though this blank was much larger than the former one, pluck and perseverence won the day and the mine kept pushing ahead.



During the next year, as may be seen from the sketch (marked June, 1898) the system of the stoping was gradually changed from underhand to overhand. The results of the adoption of this system may be seen by the outlines marked August, 1899, when development work had been pushed ahead and ore reserves had been blocked out.

The further workings explain themselves and are shown up to February, 1903.

Such is a brief outline of a portion of the history of the development of an ore chimney in Nova Scotia. To show that similar ore bodies occur elsewhere, the reader is referred to the accompanying sketch on a small scale of the Idaho Maryland quartz mine. This shows the development of an ore chimney to a vertical depth of over 2,000 feet, and it is interesting to note the poor system of development: a vertical shaft for 1,000 feet, and levels and inclines form there to the bottom.

Is there any reason to suppose that many of the other deposits of the ore referred to in the first portion of this paper, and proved so rich on the surface, could not be successfully followed in the same manner as has been done by the Brookfield Mining Company? I hold that there is every reason to suppose that many, if not all of them, could be so opened up.

Mr. E. R. Faribault, of the Dominion Geological Survey, has performed a great deal of very valuable work in most of the gold mining districts of the Province, and such work properly applied would be of the greatest assistance in opening up these abandoned mines. A careful survey and mapping of the old workings, to-

gether with accurate sampling by mill tests from all parts of the mine, and a careful study of the geological and mineralogical conditions prevailing in the underground workings, should establish the probable location and direction of the pay shoot.

The great difficulty which at the outset confronts the man who has confidence in the gold measures of Nova Scotia, and the means to prove it, is that these properties are mostly held by persons who, though not willing to work them themselves, either through lack of confidence or lack of means, demand as high a figure for the property as though it were on a dividend-paying basis. They cannot be made to sell, and easily afford to pay the small sum of fifty cents per annum for each area they wish to hold. Thus are most of the mining properties in Nova Scotia tied up. The result is stagnation in the mining industry. The Government of Nova Scotia has shown its willingness to co-operate with the mining fraternity to overcome this stagnation; but with so large a proportion of the desirable properties tied up as they are at present, it is difficult to effect much lasting good. It would seem that the remedy must lie with the mining laws. The measures necessary may seem harsh, but the present crisis would seem to call for prompt and decisive action.

NOTES FROM A TRAVELLING CORRESPONDENT.

Next to the labor question there is no topic at the moment more universally discussed in the West than the "fuel situation" and the alleged coke shortage. Every man you meet in the Kootenays has something to say on the matter and that say is usually more or less emphatic and forcibe. Generally speaking the Crow's Nest Pass Coal Company gets the major proportion of the damning, and the coloring may be fairly accurately determined by the Associated Press despatches of recent date. Unfortunately, however, the suspicion that these despatches are not entirely uninspired somewhat weakens their effect locally, and your Eastern readers may very comfortably accept all the telegraphic news bearing on the subject with tongue in cheek. It is true, of course, that there has been a coke shortage, and that in consequence output in Rossland and Boundary has been, during the past three months, restricted thereby. But it is not true that the Crow's Nest Pass Coal Company is responsible for that shortage, or has, as is alleged, unfairly discriminated against local reduction works in favor of other customers in the United States. The fact is the situation has arisen from a variety of circumstances, not the least contributory of which was the quite unnecessary and impolitic action of one of the large undertakings in the Boundary in increasing wages at mine and smelter early this summer. Just at that time labor was by no means plentiful. The rise of wages at one centre upset the equilibrium elsewhere. The price at which coke is sold to local consumers—$4.50 a ton—does not admit of any considerable addition to the cost of production, such as an all-round increase in wages would, and so men left the colliery in numbers to secure employment in the more remunerative camps of West Kootenay and Yale. The work of drawing coke ovens is at all times hard; during the hot days of summer it can only be borne by the strongest. Men were brought in to replace those who had left, but only to stay a shift or two and then depart. Here was one very real reason for output shortage. Another, none the less tangible, was the absolute inability of the Canadian Pacific Railway to supply cars and engines. The company did not treat the colliery less prejudiciously in this respect than it did the mines and smelters, for the complaint on the score of transportation inadequacies is general in the metal mining districts to this day. The fact remains, however, that the operations of the colliery company were seriously handicapped this summer by car shortage, and scarcely a week passed when it was possible to work either the mines or ovens to full capacity. No allowance for these limitations is made by those critics of the Crow's Nest Pass Coal Company's management, who are now claiming that the shortage of fuel in British Columbia is due to a large exportation this season of coal and coke to Montana and other United States smelters. The truth or otherwise of this contention will doubtless be shown from the evidence which may be demanded by the Arbitration Board appointed by the Provincial Government to investigate the question; but I am in a position to state that only during the month of July, when some of the British Columbia smelters reduced their orders and all were "stocked up," did the colliery's American customers receive, and that only in one instance, a percentage of coke or coal on their orders in proportion to the tonnage required by and supplied to Canadian consumers. In August shipments to the United States were considerably curtailed, and in September practically ceased altogether. Of course there is no use denying that the position of the company is not altogether a happy one. It stands between the Charybdis of the C. P. R. and the Scylla of the Northern Pacific. It is a case of pull baker, pull devil, and somebody necessarily has to get the worst of it. Meanwhile the effort that has been made by one side to close the Northport smelter by inducing the Provincial Government to use its alleged prerogative to prevent the export of coke for use at these works has, I am glad to learn, proved ineffectual, the authorities recognizing that any such action would necessarily be regarded by all fair-minded people as arbitrary in the extreme and calculated to injure a British company operating at heavy expense in the Province, employing a large number of men and therefore entitled to every consideration. I am not saying that it would be a bad thing for the Le Roi Company if the Northport smelter were compelled to close down; on the contrary it would, I believe, be the very best thing that could happen from every point of view; but the shareholders should at lesat have another chance to find that out for themselves, and perhaps in a subsequent letter I may present a few facts for their consideration in this regard. Meanwhile the crisis as far as concerning immediate fuel requirements appears to have passed. Both cars and labor are now plentiful, and the colliery is now, therefore, in a better position to cope with the situation. It has promised to supply the British Columbia Copper Company's requirements in full, while the Granby, to make sure of a preference, has stepped in and by the investment of from half to three-quarters of a million dollars in Crow's Nest Pass shares claims to have secured the balance of power between the two big interests. At any rate Granby interests will be well looked after by Mr. Groves, whose recent election on the Crow's Nest directorate is portentous. Finally, the C. P. R. is proceeding rapidly with the development of its coal areas at Hosmer, which in a year or so's time should be placed on a productive footing. At least, so it is hoped.

H. M.-L.

The Geological Survey's determination of the highest and lowest land in the United States is a fresh reminder of the smallness of the vertical range of the habitable globe. These points are both in Southern California, only 75 miles apart, Mt. Whitney reaching a foot or two over 14,500 feet above sea level, while Death Valley sinks 276 feet below that level.

A new electric furnace, for determining the fusion points of refractory substances, has been constructed at Hanau by W. C. Heraeus. Its essential part is a tube of iridium four-fifths of an inch thick and an inch and three-fifths in diameter, and in this temperatures between 1500 and 2000 degrees C. can be maintained for any desired length of time.

The *Iron and Coal Trades Review*, September 20th, attributes the fall in metal prices to the readjustment of supply and demand. Readustment has been made more difficult by "unrest, depression and lack of confidence in the business and financial world, "particularly in the case of copper and tin. Decreased consumption without any corresponding decline of output explains the price movements of lead and spelter.

THE ERZBERG OF EISENERZ.*

By H. Bauerman (London).

The Erzberg or Ore Mountain of Eisenerz is the largest of a series of mineral deposits associated with the Palæozoic rocks of the Eastern Alps on their northern slope, which extends from the Tyrol on the west to the margin of the Vienna basin in the east, a distance of nearly two hundred miles. These deposits, although following the same general direction, are irregularly distributed and vary very considerably both in size and in their contained minerals of value, some of them, to mention only those of the immediate vicinity, having been worked as copper mines in the district west of Eisenerz, at Kallwang, Radmer, and Johnsbach, from the year 1546 to the middle of the nineteenth century, one of them having produced about 150 tons of copper annually for a century. At present, however, only the iron ore and magnesite deposits are of importance, and among the former the Erzberg takes an exclusively prominent position.

The geological structure of the Eisenerz region is shown in a general way in the sketch map, Plate I., in the preparation of which the author has been kindly assisted by Professor von Ehrenwerth and Professor Dr. Redlich of Leoben. The southern part of the area is made up of granular and schistose rocks (grauwacke) and heavy masses of limestone with a general east and west strike, and dipping at high angles to north and northeast, which are overlain unconformably by the great masses of the Triassic formations constituting the northern limestone Alps, commencing with the Ferfen series of the lower Trias, red sandstone schists and gypsum beds, and followed by the limestones and dolomites of the Muschelkalk (Wetterstein Dachstein, etc.), forming the mountain masses of the Hochschwab, and extending to the Semmering, Raxalp, and Schneeberg districts to the eastward. The change in the formation is marked by a strong contrast in the shape of the ground, the older rocks giving mountains of more rounded outline and well wooded, while the Triassic summits rise in great wall-like cliffs, a striking example being the Pfaffenstein, which dominates the town and valley of Eisenerz and towers above the Erzberg, as shown in Plate II.

Topographically, the Erzberg is a nearly isolated conical mountain overlooking the watershed of the Enns and Mur[1] rivers, the former receiving the northern drainage of the Erzbach at Hieflau, about ten miles to the northwest, and the latter those of the Vordenberg brook, immediately above Loeben, the heigh of the dividing line at the Prebichel summit being 4,026 feet. From its summit, 5,043 feet above the sea level, the Erzberg slopes sharply to the Krumpenthal on the west and Trofeng on the east, a depth of about 3,000 feet in either direction, but to the south the inclination is somewhat less to the Platten ridge, connecting it with the great limestone mass of the Reichenstein, which is about two miles to the south, and 7,108 feet total height.

The iron ore workings are confined to the western side of the mountain, covering about three-quarters of the height, with a horizontal extension of about 1,400 yards. From the Krumpenthal, about 600 feet up the slope, the oldest member of the series, the so-called footwall or base of the ore appears. This is the "Grauwacke," a well-stratified, greenish-grey rock made up of grains of quartz and felspar crystals in a more compact base of potash, mica scales, and some quartz. This is an important rock formation as generally marking the limit between the central crystalline region of the Alps and the limestone mountains of the north. Intimately connected with the grauwacke below the ore bed is a dark grey or black siliceous slate, with inclusions of pyrites and some fossils that are referred to Upper Silurian species.

Following the grauwacke in ascending order is a heavy formation several hundred feet thick, made up of alterations of spathic iron ore, ankerite (rohwand), and a light-colored or variegated yellow and red limestone known as the Sachberg limestone, or the ore-bearing limestone by the older authorities. This contains fossil crinoids of Lower Devonian age.

The ore bed forming the highest member of the series shows a basin-like structure with an included belt of schists, containing sericite, which gives it a soapy feeling to the touch. This, while closely confirming the outline of the ore below it, is so sharply separated from it in character that it is considered by Vacek[2] to mark a division between the ore beds of dissimilar ages, the lower one being assigned to the Devonian and the latter to the Permian period. This view, however, has not been generally accepted, on the ground that no difference in mineral composition can be established between the upper and lower beds, and that the schist may represent an original barren clay parting.

At the summit of the Erzberg, above the iron ore workings on the eastern slope, the grauwacke beds with their associated limestones appear in a vertical position, or in some places with a partially reverse dip, while below, on the Krumpenthal side, the same beds dip into the hill at a lower angle. The ore bed therefore seems to be included in a plain synclinal fold, but the numerous slip faults and other disturbances exposed in the bed by the quarrying operations indicate a more complicated structure resulting from disturbances renewed at several different periods. In all probability, however, it originally formed part of the Silurian and Devonian limestone series, with which it is so intimately associated, and was subsequently transferred into spathic ore at the close of the Palæozoic but before the commencement of the Mesozoic period.

Evidence for the latter is afforded by the overlying red sandstones of the Werfen series occurring on the eastern side of the mountain, which contain in places at their base, breccias, with fragments of the ore-bearing limestones, marking the commencement of the Triassic formations of the northern limestone Alps. The western side being entirely free from newer overlying strata, the ore bed is exposed for about three-quarters of the whole length of the slope, on that side giving facilities for working the deposit such as can scarcely be paralleled in other localities.

Another view of the age of the grauwacke is also taken by Vacek, who on petrographical grounds considers it to be the equivalent of the Archæan gneiss of Blas-

*Paper read before the Iron and Steel Institute.

[1]Both rivers join the Danube but a considerable distance apart. The mouth of the Enns is a few miles below Linz, and that of the Drau, of which the Mur is a tributary, about 400 miles further down, at the lower end of the north and south reach of the Danube, through the plain of Hungary.

[2]*Jahrbuch der k. k. geolog. Reichsanstalt*, 1900.

seneck, and that it has been extensively eroded before the deposition of the Devonian limestone formation which therefore covers it unconformably. This, however, is generally contested by other observers.[3]

Spathic ores occur under similar conditions to those of the Erzberg at the Donnersalpe, about three miles west, and on the Polster, two miles east of the main deposit. At the former locality the ores, with associated limestone and ankerite beds, are frob 100 to 120 feet thick, and cover an area of about 700 acres.[4] These, from their position and relation to the overlying Triassic strata, are considered to be the remains of a series of deposits formerly continuous, which have become separated by the erosion of the Erzbach and Gerichtsgraben valleys in post-Triassic times.

The Erzberg ore, when freshly broken, is a fine-grained crystalline spathic ore, which weathers to a rusty brown limonite. The hard uncharged ore is known as Flinz, and in the early days was thrown aside as waste, only the soft brown ore being suitable for reduction in the bloomary furnaces. This was known as Blauerz (blowing-house ore). Another characteristic variety is the so-called Kernflinz, where the spathic ore is altered to limonite externally to a depth of an inch or two, the line of separation between the two minerals being very sharply defined. Mangenese and iron are present in about the proportion of 1 to 16 or 18, or considerably less than in the spathic ores of the Devonian rocks of Siegerland and Somersetshires, where the ratio is 1 to 4 or 5. Unlike the latter, however, the Erzberg ores are remarkably free from the sulphides of other metals, particularly those of copper, which are so very characteristic of spathic ores from other places. Cinnabar (sulphide of mercury) is found as a rarity, together with some iron pyrites, quartz and hæmatite. The most abundant foreign admixtures with the ores are the isomorphous carbonates of lime and magnesia, principally in the form of ankerite or rohwand, which makes up most of the waste material. This is a somewhat indefinite mixture of the different carbonates. As a rule, carbonate of lime predominates, making up about one-half, the remainder being ferrous carbonate with that of magnesia in subordinate quantity. This distinguishes it from Breunnerite, Brownspar, Mesitine, and Pistomacite, which are essentially ferrous and magnesian carbonates without lime. The following analysis of the Erzberg ankerite is due to Reibenschüh[5]:—

	Per Cent.
Ferric oxide	2.29
Ferrous oxide	23.40=$FeCO_3$ 37.75
Manganous oxide	1.69=$MnCO_3$ 2.74
Magnesite	6.08=$MgCO_3$ 12.77
Lime	24.41=$CaCO_3$ 43.58
Carbon dioxide	42.08
Total iron	19.8

Carbonate of lime occurs both as calcite and aragonite. The latter, in the coral-like forms known as *eisenblüthe* or *fios ferri*, is about the best known of the Erzberg minerals. Another form, made of alternating layers of aragonite and calcite, has received the name of Erzbergite.

The composition of the ore, as may be imagined, is subject to considerable variation. According to older analyses of K. von Hauer and Paterer[6] in 1872, the spathic ores ranged between 37 and 42 per cent. iron when raw, and 50 and 59 per cent. when calcined. The brown ores showed a greater range (between 41 and 52 per cent.), owing to the increase of siliceous waste, and for the same reason the increased yield by calcination was not as marked as with the spathic ores.

According to a statement kindly furnished by the Oesterreichische Alpine Montan Gesellschaft, the average composition taken over the whole output at the present time is:—

	Raw Ore. Per cent.	Calcined Ore. Per cent.
Ferric oxide	19.50=Fe 13.65	71.18=Fe 49.83
Ferrous oxide	32.25=Fe 29.08	1.23=Fe 0.85
	38.73	50.68
Manganic oxide	3.50=Mn [3]2.45	4.29=Mn. 3.00
Lime	5.92	6.19
Magnesia	4.06	4.14
Carbon dioxide	27.62	2.64
Water	0.84	0.14
Silica	4.08	8.19
Alumina	1.26	1.61
P_2O_5	0.034=P 0.015	0.059=P 0.025
SO^3	0.202=S 0.079	0.432=S 0.169

From this it appears that about one-fifth of the ore is weakened to the ferric condition, the remainder being made up of carbonates in the following proportions:—

	Per Cent.
$FeCO_3$	51.96
$CaCO_3$	10.61
$MgCO_3$	8.52

The large proportional increase in silica and phosphorous in the calcined ore, both nearly doubled, is probably due to additions supplied by the ash of the small coke used as fuel in the kilns.

The mining of iron ore on the Erzberg has been carried on from very early times. Traditionally the workings date back to the eighth century, but there are no authentic records older than A.D. 931. Under feudal organization the mountain, being considered as the property of the sovereign, grants were made to individual territorial proprietors, known as Radmeister, or wheelmaster, who were not merely owners of the water power, but were required to have sufficient resources in land, forests, and tenants to supply the necessary fuel and labor for effective working without outside assistance. Another condition required the proprietor to be resident. Only by special license from the sovereign was non-residence permitted, and when an aproved agent had been provided. The mining rights were defined in the thirteenth century by dividing the mountain into two parts by a horizontal plane nearly at the level of the Prebichel summit, the part above that plane (the Ebenhöhe), 3,891 feet above the sea level, being assigned to Vordernberg proprietors, and the lower part to those of Eisenerz, an arrangement which is still in force. The diversity of interests between the large number of owners—fourteen in Vordernberg and nineteen in Eisenerz—was attended with great confusion and waste in working the ores, and in 1625 the interests in the lower part were consolidated by the formation of the Inneberger Haupt Gewerkschaft, which, after passing through several changes, was incorporated as a joint stock company under the same name in 1868, subsequently becoming merged, with other principal ironworks in Styria and Carinthia, in the Oesterreichische Alpine Montan Gesellschaft in 1881.

[5] Aigner, *op. cit.* p. 169.
[6] *Ibid.,* p. 166.

The Vordernberg proprietors maintained their individuality for a much longer period. Consolidation of thirteen of the works into the Radmeister Communität took place in 1825, the fourteenth having only joined in 1871. Since 1890, the working of all the mines has been taken over by the Alpine Montan Gesellschaft, who hold 54-84ths of the Vordernberg proprietary rights.

At the time of the former visit of the Institute in 1882, underground mining was still carried out to a considerable extent in the higher part of the mountain in winter, working in the open being confined to the summer, while in the lower ground, open working alone was practised. At that date there were twenty-six quarry faces or terraces on the Eisenerz side, with room for five more up to the Vordernberg boundary; but since 1890 underground mining has been completely abandoned, and the entire face of the deposit has been laid out in a series of steps or terraces, fifty-eight in all, varying in height from 33 to 43 feet, giving a total depth of working faces of about 2,000 feet.[7] The ore, broken by hand-boring and blasting with dynamite and other high explosives, is picked by hand from the waste and carried in trucks by levels driven in from the face to the different distributing shafts and levels in the interior of the mountain. Originally the Vordernberg ores were conveyed by a horse-railway of 3-foot gauge, made in 1835 and converted to steam traction in 1878, on a falling gradient of 1 in 125 to Prebichel, whence the further drop of 1,176 feet to Vordernberg town (the terminal point of the branch railway from Leoben), was covered by a combination of inclined planes and railways; while those of the Innerberg workings were passed out by a deep adit and inclined planes to the Eisenerz terminus of the State line branch from Hieflau. Since the completion of the connecting railway on the Abt centre rack rail system, joining these points across the Prebichel pass, the arrangements have been remodelled upon the principle of collecting the output at three different levels, each one being connected with its own station on the railway. The highest of these, the Wismath main level, 4,164 feet, utilizes the old railway as far as Prebichel station, but the lower part, with the inclined planes to Vordernberg, has been abandoned. The middle section is served by the Drei König stage (3,539 feet), which is connected with Erzberg station (3,511 feet) by an electric railway about 1,200 yards long; and the lowest by the Liedemann adit at the bottom of the workings (2,962 feet), which emerges on the slope about 650 feet above the kiln plant on the Krumpenthal, which is covered by a series of inclined planes, as shown in Plate III. The ores from levels above the collecting planes are lowered by self-acting inclines or cage-drops in shafts, while those from lower levels are hoisted by water-balance lifts. Latterly, electric winding gear has been fitted in the deepest of the drop-shafts, that between the Drei König and Liedemann levels, which enables a portion of the Eisenerz output to be diverted to the Erzberg station when required. From the kilns an electric railway connects with the Eisenerz station and the blast furnace at the north end of the town.

With the improvement of the transport arrangements, the Erzberg output has increased largely. In 1882 it amounted to about half a million tons, 212,000 for the Vordernberg and 250,000 to 300,000 tons from the Eisenerz side. In 1906 it was 1,300,000 tons, about 300,000 tons from Vordernberg and the remainder from Eisenerz workings.

Until past the first half of the nineteenth century, the Erzberg ore was smelted exclusively with charcoal at numerous small furnaces at Hieflau, Eisenerz, Vordernberg and Trofojach, in the vicinity of the mines; but the growing scarcity of charcoal has led to thei ralmost complete abandonment, and out of forty-five furnaces existing in 1882, only four are at work intermittently at the present time—three at Vordernberg, with an output of from 18 to 60 tons each, and one at Trofojach making from 30 to 40 tons per day. The furnace charge is made up of 75 to 80 per cent. of calcined and 20 to 25 per cent. of small raw spathic ore, and 4 to 5 per cent. of siliceous clay flux. The fuel consumption is from 15 to 16 cwts. of charcoal per ton of metal, or, in the most favorable cases, as low as 14 cwt. The product, a low silicon white iron, resembling the plate metal of the West Yorkshire refinery, containing:—

Carbon	Silicon	Manganese	Sulphur	Phosphorus
Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
3.57	0.25	1.37	0.04	0.04

goes usually for crucible steel making.

Smelting the Erzberg ore with coke on the large scale was commenced with a pair of furnaces at Klein Schwechat, near Vienna, the fuel being brought by rail from Moravia; but these are not now at work, the main smelting operations being conducted at Donawitz, near Leoben, and Eisenerz. At the former place the number of furnaces has been increased to four, the two earlier ones having cage lifts and hand-filling, while the newer pair have inclined lifts and self-tipping charging skips. The materials smelted are calcined spathic ores, heating furnace slags, and mill scale and limestone. The coke used is mostly Westphalian, with some from Ostrau in Moravia, the consumption being about 18 cwts. per ton. The daily make is about 300 tons; the slag produced, 16.8 cwt. per ton, is granulated and thrown into the brook to be washed away during floods. The Eisenerz furnace is larger and makes over 400 tons daily. The range in composition of the metal is:—

Carbon	Manganese	Silicon	Sulphur	Phosphorus
Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
3.0-3.8	2.2-2.8	0.5-0.7	0.04-0.08	0.05-0.10

Formerly Donawitz was a puddling forge, the furnaces being fired with the miocene lignite from the mines in the hills above Leoben, but at the present time the same fuel is used in gas producers for heating a range of ten 30-ton Siemens furnaces working the basic process on magnesite bottoms, in which the bulk of the produce is converted into steel. Full details of the construction of these furnaces will be found in Professor Pavloff's atlas of the open-hearth furnace, published in 1904.[8] The puddling furnace, however, still survives in the district, a principal use being in the production of steel for crucible steel melting stock. The production of steel blooms in the open charcoal fire (Rohstahlfeuer) is still carried on in some small mountain forges, but on an extremely restricted scale, for extremely special steel-making purposes.

[7] A model showing the present state of the workings has been prepared for the Imperial Mining Academy at Leoben.

[8] Much interesting information on the Styrian works will be found in Braune's report in Vogel's *Jahrbuch* for 1900, pp. 206, 274.

Cobalt can be separated from manganese by means of potassium nitrite in the same manner as from nickel, provided a nitrate or a chloride solution is used. A sulphate solution gives unsatisfactory results.

THE EMMA MINE.

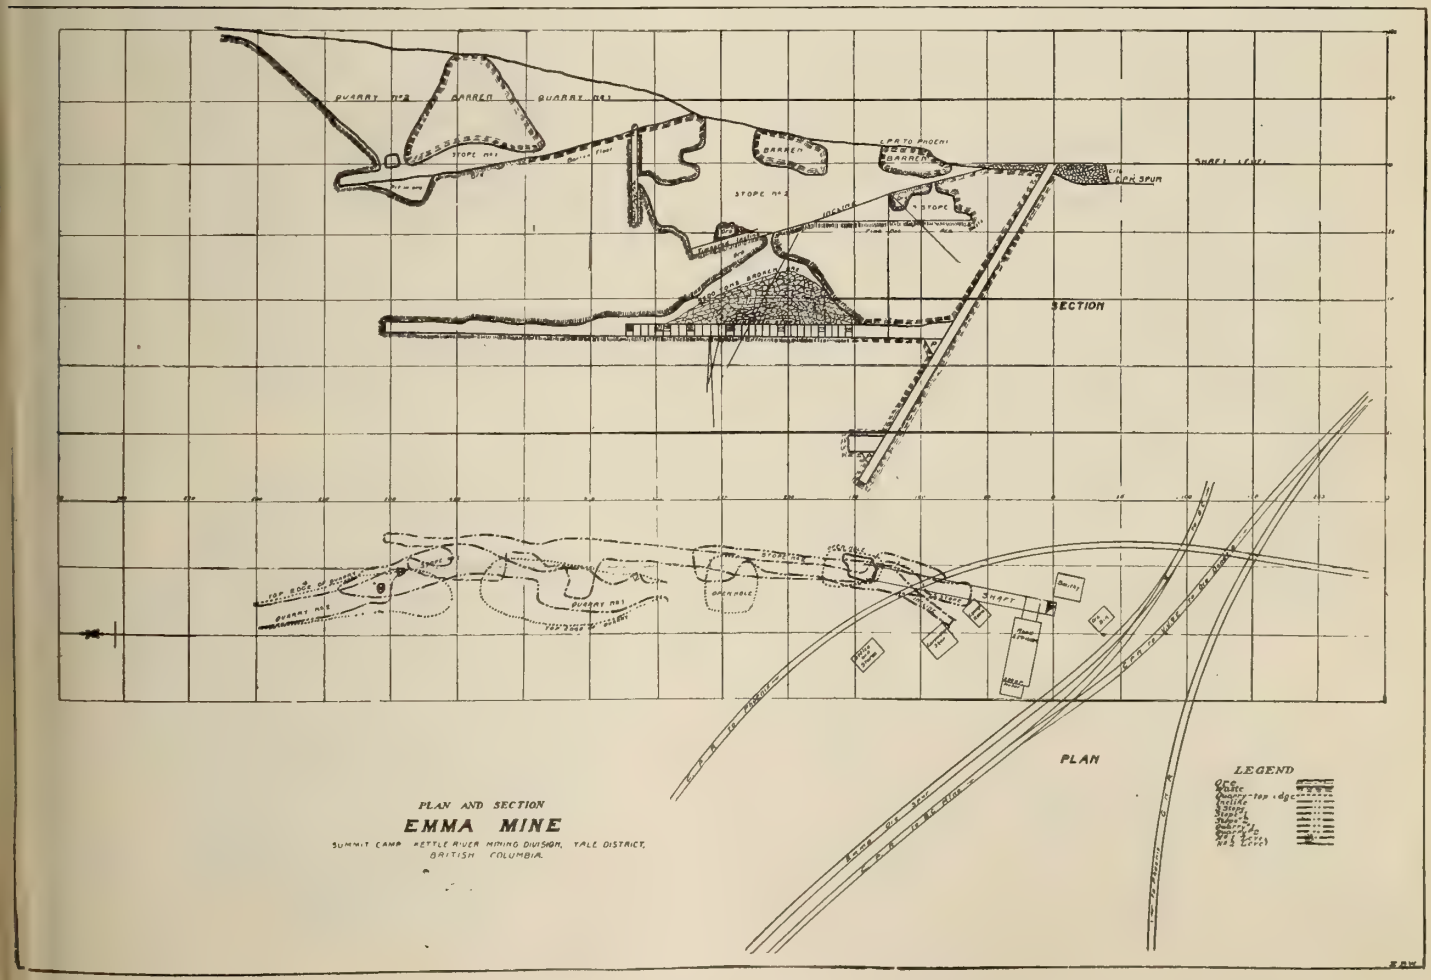
By Frederic Keffer, Greenwood, B.C.

(Toronto Meeting, 1907.)

Among the low grade mines of the Boundary District the Emma is in a way unique, in that the magnetite, which constitutes the main portion of the ore body, has persisted from the grass roots to at least the 250 level in a practically continuous vein or deposit; and also in that the vein stands vertically so far as explored.

In the other low grade mines of the district magnetite is a frequent constituent of the ores, but its occurrence is most erratic, the deposits being irregular, varying in size from a few ounces to masses of thousands of tons, and frequently dipping (so far as any dip is observable) entirely at variance with the general dip of the ores with which they are associated.

A characteristic case was that of a body of magnetite of exceptionally good value found on the 300 foot level of the Mother Lode mine, which lay perfectly flat, being about 20 by 100 feet in area, but only 7 to 8 feet thick, and which was encased in barren eruptive rocks.



In the Emma (save in Quarry No. 1, where a slip has thrown the ore about 25 feet to the southeast) the magnetite continues unbroken to a point some 200 feet below the surface, where diamond drilling has found what is seemingly another slip, throwing the ore again a short distance to the southeast. Diamond drilling on the 250 foot level has recently located the ore near the shaft.

The Emma ores are found along the contact of eruptive extensive "island" surrounded by eruptive flows. These latter rocks are of the general types characteristic of the Boundary district, analysis of which usualy lie between the limits of:—

	Per cent.
Silica	30 to 40
Iron	15 to 25
Lime	10 to 20
Magnesia	0 to 5
Alumina	5 to 15
Alkalies	0.5 to 2

To the east of this "island" of limestone are several pyrrhotite deposits, the most prominent of which is that occuring on the "Mountain Rose" mineral claim. This pyrrhotite is extensively mined for use as sulphur flux, it being sometimes essential in order to reduce the grade of copper matte, thereby avoiding unnecessary slag losses, which accompany matte running over 50 per cent. copper. This sulphur ore consists of pyrrhotite, together with varying proportions of lime, alumina and silica, but with little or often no magnetite, in striking contrast with the Emma ores, which contain little or no pyrrhotite.

On the Emma, to the south of the limestone "island," occurs a body of magnetite, which where mined was some 20 to 100 feet in area. This ore was followed to a depth of about 25 feet, where it was cut off by a slip, beyond

which no further work has been done. But little pyrrhotite was found in this place.

To the west of the limestone island occurs the main ore body of the Emma mine, which ore has been developed by quarries and drifts for some 575 feet, shown in plan and section on the accompanying map.

Most of the ore next the east wall of the deposit(which here runs about 5 degrees east of north) is magnetite, but minor bands of garnetite also occur. Along the northwest wall, however, the magnetite for the most part is next a garnet zone, which (where crosscut by diamond drilling on the 150 foot level) passes into a bluish and very silicious rock beyond which the drill was not pushed.

In other places the magnetite stands directly against snowy white crystalline limestone, which latter rock, when near the ore, frequently carries masses of magnetite and chalcopyrite embedded within it, this mineralization extending sometimes several feet into the limestone in diminishing ratio. In other cases, however, the line between this limestone and the ores is clear cut. The garnet zone is about 20 to 25 feet thick and in places carries sufficient copper to pay for mining.

More or less epidote also occurs along both walls of the ore. The magnetite frequently includes masses of crystalline lime spar, which are almost always accompanied by enrichments of copper. The garnet zone includes considerable magnetite scattered through the rock in crystals and little patches.

On the surface to the north of the workings the magnetite gives place to garnet ore well mineralized with copper pyrites. Still further north (about 1,000 feet) the garnet again crops for several hundred feet carrying good values in copper, but now dipping to the west about 70 degrees. The copper and gold contents of the ore show decided increase on the 150 foot level as compared with the ore miner in the quarries. Following are analyses and assays on two lots of several thousand tons each:—

Quarry.—Gold, 0.07 oz.; silver, .06 oz.; copper, .52 per cent.; silica, 16.5 per cent.; iron, 43.6 per cent.; lime, 12.1 per cent.; sulphur, 1.1 per cent.

150 Foot Level.—Gold, .031 oz.; silver, .06 oz.; copper, 1.28 per cent.; silica, 14.9 per cent.; iron, 40.7 per cent.; lime, 14.4 per cent.; sulphur, 1.7 per cent.

The average thickness of the magnetite deposit in the upper workings is some 18 feet, but on the 150 foot level the ore widens materially, being in places 40 feet across exclusive of the garnet ore zone. A fair average thickness of the workable ores of the mine would be 25 feet. Below are given analyses of the garnet zone, the silicious bluish drill cores beyond the garnet, the general country and also the white crystalline limestones, the rock lying immediately east of the magnetite and an approximate average of the general eruptive rock of the district. Alkalies, magnesia and other constituents present in small quantities are not included:—

	Silica	Iron	Lime	Alumina	Sulphur
Garnet zone	26.8	23.5	32.6	12.0	1.5
Bluish drill core beyond garnet	63.6	5.3	4.5	16.9	.52
Limestone country rocks	18.3	2.3	43.9	5.6	.00
White crystal limestone	7.6	.8	56.0	.3	.12
Rock next the magnetite on the east	38.5	6.5	27.6	19.3	.47
Eruptives	35.0	20.0	18.0	15.0	

It is evident from these analyses that the limestone and eruptives contain in sufficient measure all the constituents necessary for the formation of the garnet and magnetite zones. That these latter rocks were produced by the hot water gases and water carrying dissolved mineral derived from the eruptives, reaching upon the adjacent limestones through replacement and recombination, can hardly be doubted.

It is seen from the analyses of the ore that the sulphur present is very small, barely more than sufficient to form the copper pyrites present.

Iron sulphides are of rare occurrence, and it seems certain that the magnetite was deposited as such, and did not result from the alteration of sulphides. This view is vorne out by the fact that as a rule magnetite crystals and not iron sulphides are found in the garnet zone, however far removed from the main body of magnetite. The crystalline limestone found next the magnetite in the mine is considerably purer than the main portion of the limestone formation.

The accompanying photographs of rock sections from the Emma throw an interesting light on the formation of the deposit. Fig. 1 is a speciment of garnet ore, and

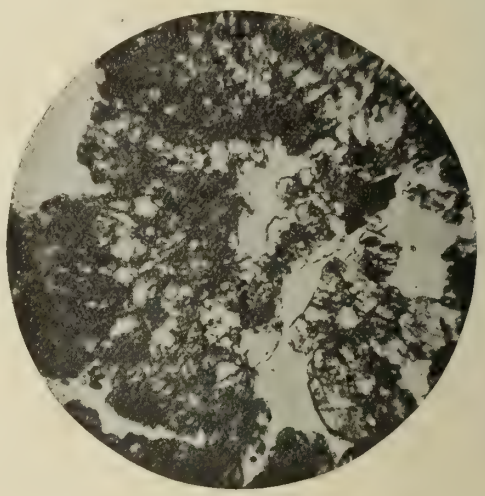


Fig. 1.

shows a limestone in the course of alteration to a garnet rock. Some calcite remains, but it has mainly been replaced by garnet, together with a little quartz. Copper pyrites run through the mass in irregular strings and bunches, and there are also some bits of magnetite.

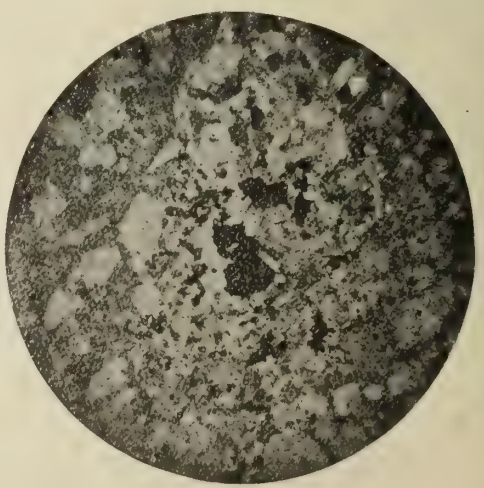

Fig. 2.

Fig. 2 represents a rock from the 150 foot level, in which all the original mineral has been replaced by plagioclase, feldspar and actinolite, together with some copper sulphides. This rock is probably an altered eruptive rather than a limestone replacement.

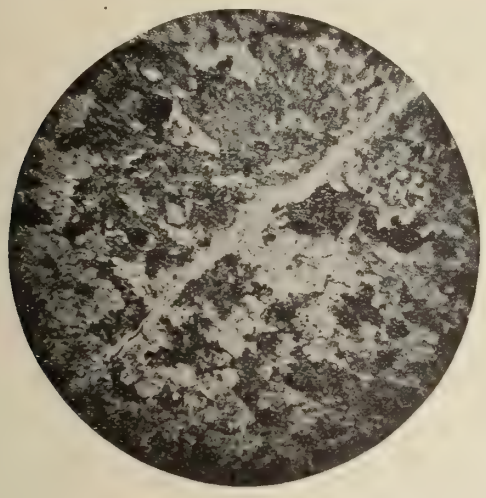

Fig. 3.

Fig. 3 is a section of the rock which cuts off the Emma deposit on the south. It is chistose through great pressure, and is mainly composed of feldspar and hornblende. A few crystals of iron sulphide are also present.

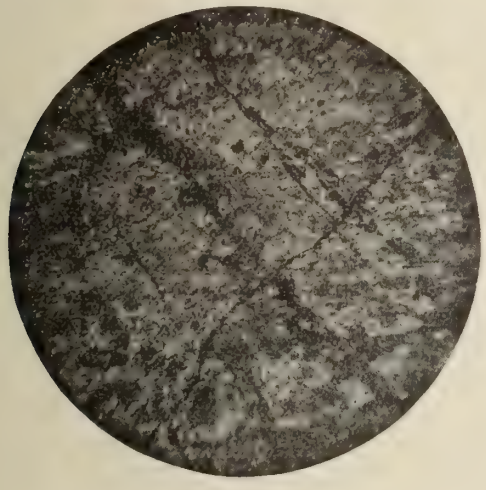

Fig. 4.

Fig. 4 is from near the ore on the 250 foot level, 40 feet north of the Emma shaft, and, like Fig. 1, shows limestone in the course of conversion to garnet.

Some pyroxene is present in small grains, and all the calcite which remains is in minute lines running through the rock.

The sections are magnified 25 diameters.

Mining.—Owing to the vertical position of the deposit, mining here is a much simpler problem than in most of the Boundary mines. The shaft is a two compartment incline, angle 60 degrees. Across the drifts are placed heavy stulls supported by posts, the stulls and posts in the widest portions of the drift being often 30 inches in diameter.

The stulls are placed 5 feet apart, and are covered with 8 to 12 inch pole lagging. Chutes are provided at convenient intervals, they being at the opening 3 1-2 to 4 feet wide by 2 to 2 1-2 feet deep, so as to allow large rocks to pass. The ore is broken down on the timbers to the level above, only the swell being drawn from the chutes, which swell amounts to about 40 per cent. After the level above is reached the stopes can be drawn at will, and, commencing at the point furthest from the shaft, the timbers can be removed if in condition to be used elsewhere. In commencing a stope it is of course necessary to first raise to the level above to secure ventilation. In portions of the work where bodies of crystalline limestone or poor garnet ore are found these are left as pillars to reduce the cost of timbering. The ore is so heavy, averaging from 8 to8 1-2 cubic feet to the ton when in place, that timbering must be of the heaviest description to bear the weight above, which weight, owing to the vertical walls, rests almost entirely on the timbers. Power is supplied from the Bonnington Falls electric plant, some 85 miles distant, the machinery at the mine consisting of a 12 drill cross-compound Rand compressor, driven by a 200 h.p. motor, together with a hoist, now driven by compressed air, but which will shortly be replaced by an electric hoist. There is also a steam driven X Ingersoll straight line class A compressor, capacity about 8 drills, which machine is held as a reserve.

There have been shipped from this mine to date some 93,500 tons of ore.

NOTE.—Rock sections were furnished through the courtesy of Dr. Frank D. Adams of McGill University, who also made a petrographic examination of them.

BOOK REVIEWS

TABLES OF MINERALS — INCLUDING THE USES OF MINERALS AND STATISTICS OF THE DOMESTIC PRODUCTION, BY SAMUEL LEWIS PENFIELD, M.A., LLD. 8VO., VI X. 88 PAGES. CLOTH, $1.00. NEW YORK, JOHN WILEY & SONS, 1907.

Part I. of this new book consists of a list of minerals arranged according to the six systems of crystallization. Part II. gives an arrangement of the minerals according to the elements, with their uses. Statistics of production are also included. In Part III. a number of useful minerals are described, such as corundum, mica and talc. Part IV. gives lists of minerals according to geological occurrence and association. The general classification is Igneous, Sedimentary, Metamorphic and Accessory Minerals. Veins and vein minerals and minerals resulting from contact metamorphism are touched upon.

For the mining engineer whose geological knowledge is in need of repairs this little book will prove most useful. The several methods of classification are suggestive. While by no means a text-book, the volume will be found a convenient and ready source of reference.

The *Mining World,* October 5th, presents an article on "The Sudbury Nickel-Copper Field, Ontario," by Ralph Stokes. Mr. Stokes recommends the encouragement of a new nickel producing plant in the Sudbury region. Competition, he thinks, would lower the price of nickel and lead to a great expansion of trade. In this we cannot agree with Mr. Stokes. A knowledge of Sudbury's rise and development and familiarity with the present conditions of the nickel market and industry will lead to a modification of this view.

GYPSUM AND GYPSUM PRODUCTS IN 1906.

(Condensed from a Bulletin of the United States Geological Survey.)

Pure gypsum is a hydrous lime sulphate having a chemical formula $CaSO_4\ 2H_2O$. Reduced to percentages of the weight it may be represented as follows:—

Gypsum ($CaSO_4\ 2H_2O$) { Lime Sulphur ($CaSO_4$) { Lime (CaO) ..... 32.6; Sulphur Troxide (SO_3) 46.5 } 79.1; Water H_2O ..... 20.9 }

Few deposits of rock gypsum are ever approximately as pure as this. Clay, limestone, magnesian limestone, iron oxide and silica are usual impurities.

Where gypsum occurs in an earthy, granular condition, it is known as gypsite and may carry 10 to 20 per cent. of impurities.

Dehydration to this extent can be accomplished at any temperature between 212 degrees F. and 400 degrees F. It is found most economical of fuel and time to carry the process at the highest allowable temperature.

A general plan of calcining plaster—the size and weight of machinery depending upon the capacity desired—is as follows:

The gypsum rock is crushed first in a jaw crusher; second, in a pot crusher; and then it goes to a rotary kiln drier. This drier is erected in brickwork like a boiler, and is equipped with an automatic feeder. If soft coal or wood is used as fuel, care must be taken that the products of combustion do not come in contact with the materials being dried, on account of the danger of discoloration. Fuel of any kind—oil, gas, coke, wood, or coal—is suitable. This drying process, eliminates 10 per cent. of the moisture. Next, the crushed rock is

Distribution of Gypsum.—Gypsum occurs in sedimentary rocks of practically all ages, either in the crystalline form or as rock gypsum, and it is widely distributed over the world. It is commonly found near beds of rock salt. In the United States workable deposits are confined to beds of rock gypsum, which occur east of Missouri River in Paleozioc rocks, while those of the West are mostly of Mesozoic and Tertiary age. Gypsum is produced in seventeen States and Territories, besides Alaska. Mills for grinding and burning it are operated at nearly all the places of production.

Uses.—Most of the gypsum produced is manufactured into the various plasters, such as plaster of Paris, stucco, cement plaster, flooring plaster, hard-finish plaster, etc. A steadily increasing quantity is being used as a retarder in Portland cement. Refined grades of plaster are used in dental work, also as cement for plate glass during grinding. Considerable quantities are ground without burning and are then used as a low grade fertilizer, while smaller quantities are used in the manufacture of paint and paper, imitation meerschaum and ivory, and as an adulterant. The pure white massive form, known as alabaster, is much used by sculptors for interior ornamentation. The reputed excellence of British beers is attributed to the presence of calcium sulphate in the natural water used in their preparation.

Chemistry and Practice of Gypsum Burning.—In addition to the combined water, the rock may contain as much as 25 per cent. of absorbed moisture. If pure gypsum is heated to a temperature of more than 212 degrees F. and less than 400 degrees F., all the moisture and a certain definite portion of the combined water will be driven off, and the gypsum thus partially dehydrated will be plaster of Paris. The composition of plaster of Paris may be represented thus:

$CaSO_4\ \frac{1}{2}H_2O$ { Lime Sulphate ($CaSO_4$) ..... 93.8; Water (H_2O) ..... 6.2 }

sieved in a trommel, generally to 24 mesh. The material that does not pass the sieve is ground in buhr mills, and this product, with the screenings from the trommel, is ready for boiling. The boiling is done in a large kettle with wrought steel sides and cast iron or very heavy steel convex bottom. Flues pass through the kettle near the bottom and distribute the heat, which is applied below the kettle and passes around the lower part of the sides, through the flues, and then around the upper part of the sides and out at the stack. Inside the kettle is a shaft, which propels stirrers below the flues and mixing paddles above. The kettles are heavy and rest on brickwork. The ground gypsum is fed from bins into the kettle, and is constantly stirred and boiled until the remainder of the free moisture is expelled. The temperature of this preliminary boiling should not exceed 265 degrees F., for at a higher temperature the water of crystallzation, or combined water, begins to separate, and then the separation must be completed or the calcination will be a failure. To remove the necessary three-fourths of the combined water the material is then heated steadily to a temperature of 390 degrees to 395 degrees F. Care must be taken not to allow the temperature of this second boiling to exceed 400 degrees, or all the combined water will be expelled and the plaster will lose its setting properties. When properly boiled the gypsum settles and may then be discharged through a gate on the side near the bottom of the kettle. After boiling, the plaster should be screened again through 40 mesh wire cloth, and the oversize should be reduced in a finishing buhr mill.

To manufacture 100 tons of plaster a day the following machinery is required:

1. A crusher; estimated cost, $1,000. 2. One direct heat drier, 48 inches in diameter and 27 feet long, together with one dust room; estimated cost, $2,500. 3. One pot or bowl crusher for fine grinding the material

after drying; estimated cost, $300. 4. Four French buhrstones for grinding; cost, about $300 each. 5. Two calcining kettles, $200 each. In addition to the above mentioned machinery the necessary elevators, conveyors, shafting, belting, and bins are required. On account of the nature of the process and material, the bins, elevators and conveyors should be made of steel, and the entire plant should be as nearly fireproof as practicable.

Trade Conditions.—Active demand for gypsum products continued throughout the year 1906. New deposits were discovered in Riverside County, California, and other localities. Alaska became a producer of gypsum. Increasing trade is very generally noted. At Mabou, Nova Scotia, a new mine has been opened, the output of which will be shipped by water to New York points.

Production and Disposition.—The gypsum mined in the United States in 1906 amounted to 1,540,585 short tons, valued at $1,147,129. This production represents an increase in quantity of more than 47 per cent., and in value of nearly 40 per cent., as compared with that of 1905. The total number of producers at the close of 1906 amounted to 74, as against 46 in 1905. The State of Michigan holds first place, New York second, with Iowa a close third. The average price per ton for crude gypsum was 74 cents. The maximum reported was $1.47 in California, Nevada and Oregon. The minimum, reported from Wyoming, was 24 cents.

One hundred and eighty-six thousand nine hundred and ninety-nine tons of the gypsum produced was sold crude; 62,671 tons sold as land plaster; 899,581 tons sold as calcined plaster.

Imports.—Gypsum imported into the United States comes almost wholly from Nova Scotia and New Brunswick, with the exception of a few hundred tons annually from France and the United Kingdom. It enters the ports of the New England and Northern Atlantic States, over one-half entering the port of New York. The gypsum imported is nearly all calcined and converted into wall plaster. For the year 1906, a total quantity of 3,587 tons, valued at $22,821, of ground or calcined plaster was imported; and 436,999 tons of unground, valued at $464,725.

Canada.—Gypsum occurs in New Brunswick, near Hillsboro', Albert County, and near St. John Harbor; in Nova Scotia, in many localities, such as Windsor, South Maitland and the intervening district, and at Baddeck, Cape Breton. In Grant and Haldimand Counties in Ontario, and on Manitoba Lake, Manitoba, there are also large deposits. The deposits of the Maritime Provinces are of most interest to the American producers. Most of this Canadian gypsum is calcined in plants near seaboard cities; but a considerable quantity is shipped as far inland as Syracuse, N.Y.

COAL BRIQUETTING IN THE UNITED STATES

Paper read at Toronto Meeting of A.I.M.E.

(Continued from last issue.)

California.

The manufacture of briquettes has shown more actual progress in California than any any other State of the Union. This has been brought about through the efforts to improve the fuel quality of the rather low grade character of the California lignites, and has been encouraged by the high prices of the better grades of bituminous coal or anthracite brought into the State from Washington, the Rocky Mountains, and Eastern States, or imported from British Columbia, England, Australia, and Japan. It has also been encouraged by the cheap asphaltic pitch obtained from California petroleum, which not only serves excellently as a binder but adds to the calorific value of the briquetted fuel.

The first plant to be put into successful operation in California was one built at Stockton by the San Francisco & San Joaquin Coal Company. The plant was completed in 1901, and when running at full capacity could produce 125 tons of briquettes per day. The fuel used was lignite from the Tesla mines, in Alameda County. The plant was, unfortunately, entirely destroyed by fire in 1905 and has not been rebuilt. It is stated that the plans of the company were to rebuild the plant at San Francisco, but these were upset by the earthquake and fire which destroyed a large part of that city in April, 1906. A complete description of the Stockton plant by the designer of the presses, Mr. Robert Schorr, of San Francisco, has been published.[7] The briquettes produced at this plant were round, convex lenses or "boulets," which weighed from 6 to 8 ounces.

The Western Fuel Company, of Oakland, completed early in 1905 a briquetting plant, also designed by Mr. Schorr.[8] In mechanical construction this plant differs materially from the one destroyed by fire at Stockton. The shape of the briquettes is cubical instead of "boulet." The advantage claimed for the cubical shape is that the briquettes ignite more readily, though it is admitted that in handling the same mechanically there is more waste.

The capacity of this plant is 480 briquettes per minute, or 8.5 tons per hour. The fuel used is coal yard screenings from lignites, anthracite, and sub-bituminous coals, with about 7.5 per cent. of asphaltic pitch. This pitch is obtained by the distillation of California crude petroleum. The temperature of the still, for the production of the proper grade of pitch, is about 600 degrees F. Some difficulty has been experienced in securing the right quality of pitch on account of the tendency of the refineries to "rush the stills," their aim being the securing of refined oils rather than pitch. An excellent grade of asphaltic pitch is obtained by keeping the stills at a temperature of 500 degrees F., using a vacuum to force the distillation. Grade "D," the quality best adapted for the purpose, is fairly hard up to 60 degrees F., but begins to soften above that point. It becomes liquid at 250 degrees F., and has a specific gravity of from 1.05 to 1.1.

Before the earthquake, the Western Fuel Company paid $10.50 per ton for the ordinary pitch "D" delivered at its plant, while a properly and carefully prepared pitch was worth from $12 to $13.

[7] *The Engineering and Mining Journal,* vol. lxxviii, p. 262 (1904).

[8] *The Engineering and Mining Journal,* vol. lxxx., p. 389 (1905).

Owing to the enormous building activity in San Francisco since the earthquake, the demand for asphaltum for roofing materials has increased in leaps and bounds. Consequently, there is a great scarcity, and the price per ton now ranges from $14 to $20. This scarcity necessitated many shut-downs of the plant at Oakland, and for that reason the company is negotiating for the importation of coal tar pitch from the East and from Europe. As three new refineries are contemplated, conditions may gradually return to their normal stage.

All of the coal purchased and mined by the Western Fuel Company is brought in ships and is unloaded by electric hoists into receiving bins. When drawn from the storage bins it is screened, all material passing through the perforations dropping into auxiliary bins from which it is fed into a Williams crusher. The disintegrated coal from the Williams crusher is elevated into the iron hopper of an automatic feeder which feeds into the coal heater. The heated coal enters the mixer and meets there the binder. The mixer as well as the binder distribution and the tempering of the mixture embody some novel features.

The prepared material is conveyed into the feed hopper of a Schorr press, style "A," which is belted for 6 revolutions per minute. At that speed 480 briquettes of 9.5 ounce weight are discharged in one minute, or more than 17,000 pounds per hour. The briquettes are of a rectangular shape, 2.75 by 2.5 by 1 7-8 inches thick, with rounded corners and branded with a "W." They are uniform in size, and have a specific gravity of about 1.22.

All wearing parts of the press are lined with phosphorus bronze, and they are thoroughly lubricated under an air pressure of 40 pounds per square inch. Oil is also atomized and sprayed into the moulds and upon the plungers.

The briquettes drop upon a short conveyor delivering the same to another one located outside the building. At this point provision is made to sack the briquettes for the local market, or to take them up to the top of the storage bunkers, where arrangements are made to discharge the briquettes into cars or to distribute them into the bunker compartments. The average output is 64 long tons per shift of 8 hours, four men being employed, one of them getting $4, one $2, one $3, and one $2.75 per day, which makes about $0.20 per ton of briquettes. By running 24 hours more than 200 tons could be made, which would reduce the labor item to about 14.5 cents per ton. This can be further cut down by speeding up the press to 7 revolutions per minute, which would produce 560 per minute, or 20,000 pounds of 9.5 ounce briquettes per hour. With a forced feed attachment a further increase in speed may be possible.

Since the foregoing was written, wages have been increased considerably, most of the men getting $3.50 per shift, working through the lunch hour.

The present pressure arrangement was tested up to 48,000 pounds, exerted upon two 2.5 by 2.75 inch surfaces, making more than 3,700 (?) pounds per square inch. The adjustment is placed to give about 2,900 pounds, which is ample, and makes a better-burning briquette than when a greater pressure is used. The press is designed for a maximum pressure of 6,000 pounds.

The briquetting press has been described by Mr. Schorr substantially as follows:[9]

"In this press two sole plates with heavy bearings are arranged to carry a stationary steel shaft, upon which a large spur wheel is revolving, driven by means of gearing, countershaft and friction clutch pully. The spur wheel rim is made integral with a mould ring which has a series of holes and sliding plungers (pistons) therein. The pistons are under continuous control of cams which are supported by heavy shields. The pistons are released from the camway only when the final pressure is applied, and this is done by a large wheel with steel tire, pivoted in two levers.

"This wheel is pressed against the piston heads by means of an adjustable spring, which permits a perfect regulation of pressure up to 4,000 pounds per square inch. After leaving the pressure wheel, *i.e.*, after the briquette is made, the plungers are gradually forced forward to eject the briquettes, which drop upon a vibrating discharge chute.

"The pistons are then gradually withdrawn, and in passing the feed box the cavities become filled with the mixture of coal and pitch. At the end of this feed box all surplus material is scraped off by a steel plate. After passing the scraper plate the pistons are gradually forced in, pressing the material against the resistance block, which is supported by the main shaft. This pressure is effected by a cast iron stand with phosphor-bronze liner.

"When the pistons are about 0.5 inches from their terminal, they strike against the rocking pressing wheel and are forced home. In this way the briquettes are made, and the play repeats itself with every revolution.

"The machine is entirely self-contained, and it is claimed that there is no possibility of its getting wrecked by overfeed or obstruction. It is also claimed that as the pressure is applied slowly and gradually, this type of press permits briquetting mixtures containing from 13 to 14 per cent. of moisture, and that it is an advantage not possessed by intermittently-acting presses. Up to the present time two press designs have been made, the one with two rows of 2 inch cylindrical moulds, and the other with two rows of 2.5 by 2.75 inch rectangular shapes with rounded corners. There is no difficulty in making other shapes and heavier briquettes. A simple arrangement permits working with half the capacity whenever desired. No complications are presented if it is desired to have more than two rows of moulds, and the type of press can be built for a much larger capacity. On the other hand, should the market for briquettes be limited for some months in the year, the capacity can be cut down without requiring any change in speed or other alterations.

"From 80 to 120 briquettes are made for each revolution, the number depending on the size and shape of the briquettes, which govern also the capacity. The same varies from 6 to 24.5 tons per hour. The briquettes are uniform in size and plainly branded with 'W.'"

Mr. Schorr says that all wearing parts of the machine can be quickly and cheaply replaced. The lubricating is done by an air compressor and oil atomizer.

The press is especially adapted for the manufacture of small briquettes, and the use of such in preference to large blocks is obvious. Small briquettes can be readily shoveled into furnaces, while the large ones have first to be broken up, thus causing labor, waste, and dust.

A briquetting plant of an entirely different type, designed by Mr. Chas. R. Allen, was built and put in operation by him during 1905 at Pittsburg, at the junction of the San Joaquin and the Sacramento Rivers, about 50 miles from San Francisco. This plant, as originally projected, was intended to utilize the lignite produced by

[9] *Engineering and Mining Journal*, vol. lxxx., p. 627 (1905).

the Pittsburg Coal Mining Company at Somersville, but the enormous increase in the production of oil in California has had such a demoralizing effect upon the coal trade generally that there has been little or no market for lignite during the last two years, and these mines have been shut down. The material used has, therefore, been screenings obtained from the coal yards of San Francisco, the binder (here as at other plants in the State) being asphaltic lignite, and as long as the supply of this material is available at such prices it will continue to be used.

The methods of preparing the briquetting mixture differ somewhat from those used at other plants in that the binder is passed, together with the fuel, through the retorts under a high degree of heat. This, it is claimed, insures an intimate and thorough mixture, each particle of fuel being impregnated with the binder. This treatment, it is asserted, prevents the binder from being consumed before the coal is ignited, which is apt to be the case, particularly with lignites, if the mixing is merely superficial.

Mr. Allen claims that in his process the nature of the fuel is changed so that the lignite partakes of the character of bituminous coal, the briquettes remaining firm and hard until entirely consumed. He claims also that the process possesses as much of novelty and value as the press.

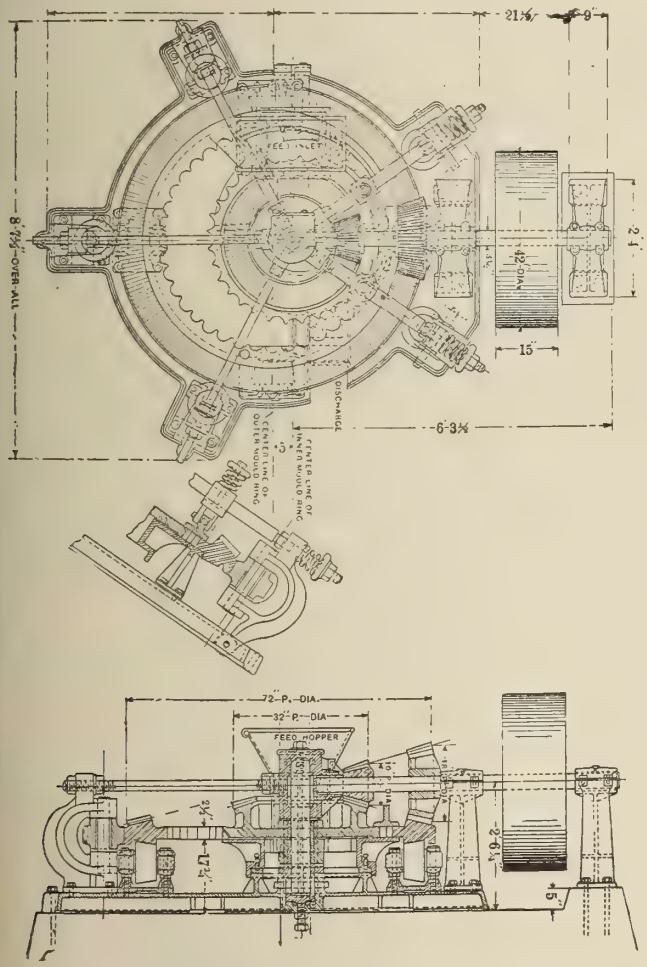

Fig. 11.—Allen Briquetting-Machine. (Plan and Elevtion.)

As shown in Figs. 11 and 12, the compressing machine consists of two non-concentric rings horizontally placed, one within the other, the periphery of the smaller one being corrugated, or scalloped, and engaging with similar corrugations in the inside of the larger ring. The briquetting mixture is fed into a hopper one-fourth of a revolution of the smaller ring from the point of compression, and the amount of pressure is regulated by the distance of the feed from the point of compression; that is to say, the hopper may be placed further away if a

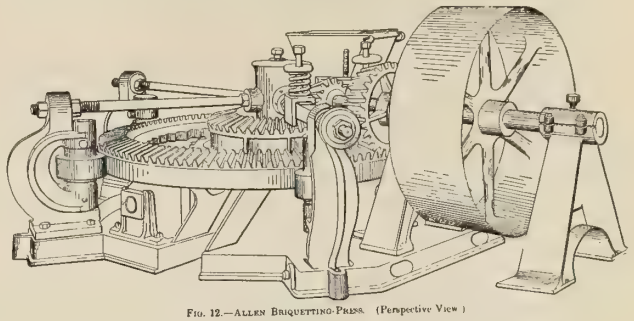

Fig. 12.—Allen Briquetting-Press. (Perspective View.)

Fig. 12.—Allen Briquetting-Press. (Perspective View.)

greater pressure is desired, or nearer, if the pressure is to be reduced. Relief from an excess of pressure is provided for by two heavy spiral springs on the outer bearings, and two over the upper pressure plate, the lower pressure plate being fixed. The relief springs are shown in Fig. 11. The machine has been operated without using any of the springs, with the result that when there was a surplus of feed the operating belt was thrown off through the choking of the machine.

Mr. Allen's invention is patented.[10] The briquettes, as now made, are approximately cylindrical in shape, with flat ends. They weigh from 8 to 10 ounces each, and have a specific gravity of 1.14. It is Mr. Allen's intention to reduce the size of the briquette and change its shape by having the smaller ring of the press made without corrugations. This will be done in order to meet the demand for a briquette adapted for domestic use.

The plant is at present turning out about 5 tons of briquettes per hour, at a moderate running speed. With a smaller briquette the production per hour would be decreased, with the same speed, while with an increased speed the same production could be maintained, even with the smaller briquette.

The Standard Coal Briquetting Company, of Oakland, constructed in 1905 a plant designed by a Mr. Crawford. An accident to the press shortly after being put in operation practically wrecked it, and the enterprise was unsuccessful.

Another plant beginning operations in 1905 was a small plunger type of press designed by Mr. A. Demetrak, and built by the American Briquetting Company (afterwards reorganized as the Ajax Briquetting Company), of San Francisco. It was destroyed by the earthquake and fire of April, 1906, and has not been rebuilt. The plant had a capacity of about 15 tons a day, using Coos Bay, Ore., lignite, sometimes mixed with coal yard screenings, and asphaltic pitch.

The United States Briquette Company, of Stege, Contra Costa County, has undertaken the manufacture of briquettes from a mixture of peat and California crude petroleum. This plant had not been completed at the time of writing this report, but some briquettes made of the mixture in an experimental way are interesting productions. They give promise of a method of using California oil as a domestic fuel, the peat, on account of its spongy character, acting as a carrying vehicle for the oil, and at the same time performing duty as fuel. The briquettes are cubical in shape and of attractive appear-

[10]U. S. Patent No. 851,007, April 23, 1907.

ance. They weigh about 10 ounces each and have a specific gravity of 1.3.

It is claimed that they are as well adapted for steam-raising as for domestic purposes, giving an intense heat under forced draft, and burning freely under ordinary draft; that they can be handled without waste from breakage, and that they leave a minimum of ash and do not clinker.

Arizona.

The Arizona Copper Company, of Clifton, installed, during 1905, a briquetting plant purchased from Messrs. Yeadon, Son & Company, of Leeds, England. The plant was put in operation in September, 1905, and, during the first six months of 1906, produced 690 short tons of briquettes of a total value of $4,830, or an average of $7 per ton. About 300 tons were produced in the experimental runs made in 1905. It was installed for the threefold purpose of utilizing coke breeze, which is without value and non-usable as such; for securing better efficiency out of the slack coal (Gallup) which is used as fuel; and for obtaining a fuel that could be stored without material deterioration, and without danger of spontaneous ignition. Mr. James Colquhoun, president of the company, affirms that what economic advantages are secured are from the first and third operations. In the briquetting of the coke fines or breeze a profit of about $4 per ton is made in the conversion of a formerly-wasted material into a usable fuel. In using the Gallup, N. M., slack, which is of sub-bituminous, or black lignite, quality of coal, the expense of briquetting brings the total cost up to approximately $6.80 per ton, or about the same as that of the lump coal obtained from the same source, although the price for the slack at the mines is very low when compared with that of lump coal. The briquettes have been found to burn freely and satisfactorily under locomotive and stationary boilers, and appear to be equal to the best of Gallup lump coal, but no laboratory tests of calorific power have been made.

The real profit in the briquetting of this coal is in the superiority of the briquettes over lump coal for stocking purposes. They stand weathering perfectly, while the lump coal disintegrates upon exposure, loses a portion of its combustible gases, and becomes in time a very inferior fuel. It is also liable to spontaneous combustion, which the briquettes are not.

In the making of the briquettes 92 per cent. of the coal is mixed with 8 per cent. of California asphaltic pitch. The capacity of the plant is 2.5 tons of briquettes per hour.

The following description of the process at Clifton has been furnished by the company. In design the press is similar to the one used by the United States Geological Survey coal testing plant at St. Louis. This was designated as the "English" machine, and has been described in the reports of those tests.[11]

The process of making briquettes of coal or coke fines is that of Yeadon, Son & Company, of Leeds, England. The fines are fed from the bins into the boot of a bucket elevator, which discharges them into the hopper at one end of a mixer, where they are mixed with pitch that has previously been broken in a pitch breaker into pieces of 0.5 in. maximum size. The quantity of pitch found to give the best results is about 8 per cent.

From the mixer the material is sent into a disintegrator, which thoroughly pulverizes the coal and pitch into grains of 2-mm. size and under. It is then elevated and passed into a heater, where it is subjected to the action of live steam, which gives the pitch sufficient fluidity to bind the other ingredients.

From the heater the material drops into a pug mill, which, while stirring the mass, sweeps it into a false bottom. This false bottom is behind the disc of the briquetting machine, and, at each revolution of the main shaft, the material is rammed into a pair of compartments in the disc. The disc contains eight pairs of such compartments, and at the same time that a pair of briquettes is being rammed into the disk on one side, another pair is being compressed on the opposite side, while a third pair is being pushed out from the top of the disc into an endless belt conveyor, which delivers the briquettes to the side of a railroad car in front of the building. The briquette disc is made to revolve intermittently in eight periods to each complete revolution. During the pause in each period, the three operations referred to take place simultaneously.

The capacity of the plant is 25 tons per 10 hours. It is arranged to mix three ingredients into material for briquettes, but at present only the fines from coal or coke and pitch are used. The briquettes are rectangular in shape and weigh approximately 4 pounds each.

Michigan.

The Semet-Solvay Company, of Syracuse, N.Y., has recently completed the construction of a briquetting plant at Del Ray, to be operated in connection with the by-product coking ovens and chemical works installed there several years ago by the same company. The installation of the briquetting plant was begun about two and a half years ago. As originally constructed, the briquetting machine was a reciprocating press of English make, but after carefully working out the process the company came to the conclusion that a press of the reciprocating type is adapted only to large briquettes, whereas the markets for which this product was intended demanded a small briquette for the domestic trade.

As the result of the experience gained with the English machine, the company has developed a process for the manufacture of small briquettes, and although this plant is just beginning to run it gives excellent promise.

The process consists essentially of the intimate mixing of finely powdered pitch of proper quality and consistency with pulverized coal, so that theoretically each particle of coal is coated with the fine pitch. The mixture is then brough up to the proper temperature with steam, or steam and hot water, and is fed to a rotary Mashek press built by the Traylor Engineering Company, of New York. The output of the plant is from 10 to 15 tons of briquettes per hour. These are from 2.5 to 3 ounces in weight, and about 1 7-8 inches square, shaped somewhat like a miniature sofa pillow. This shape is satisfactory for shoveling and for handling in household stoves and furnaces. The company is using a portion of coke breeze with the coal and pitch, with a view to making use of the breeze from its coke plant, and it is also experimenting on the best mixtures and the best grades of coal. The briquettes made so far are said to burn well and to give no smoke, except a slight puff when they are first thrown on the fire. As the plant is not yet in full running, some minor adjustments are still being made to perfect the product, but the operators are much encouraged by results so far obtained, and expect within a short time to be making a thoroughly satisfactory and commercial product.

Missouri.

Renfrow Briquette Machine Company. - During the summer of 1903, Governor W. C. Renfrow, of Oklahoma,

[11] *United States Geological Survey Bulletin* No. 261, and *Professional Paper* No. 48.

became financially interested in a briquetting company in St. Louis. In the fall of the same year Mr. E. D. Mizner, of Hamilton, Ont., visited St. Louis to make a report for some Canadian interests relative to the purchase of the Canadian rights for the patents of this company. The results of these investigations, and the efforts of Govrenor Renfrow to force the briquette company to deliver a machine, ended in the bankruptcy of the company. In October, 1903, an agreement between Governor Renfrow and Mr. Mizner was made by which Mr. Mizner was to build a briquette machine which would overcome the difficulties encountered by the former press. No company was organized at that time, but contracts were drawn satisfactory to the people interested.

The following spring, Mr. Mizner built the first Renfrow press, which made briquettes 2 inches in diameter, weighing about 4 ounces. This press had some of the essential features of the present Renfrow press, but made briquettes only at one end of the stroke; that is, 12 briquettes per revolution. After this machine was built it was discovered that the briquettes were too small and that the construction of the machine was too light. Mr. Mizner also developed the idea of making briquettes at both ends of the stroke, thus doubling the capacity of the machine. It was decided to build a much heavier machine, and one making a briquette 3 inches in diameter. Changes were also made in the method of mixing and heating the material. The cast iron vertical heaters of the original press were supplanted with horizontal acketed heaters, using ordinary spiral conveyor flights for mixing and handling the fuel. To this was added a short vertical heater acting as a reservoir, into which live steam was admitted just before the mixture was delivered to the moulds.

The briquetting portion of the Geological Survey coal testing plant at St. Louis during the Exposition has already been described.[12] After the close of the Exposition the "American" machine, installed by the National Compressed Fuel Company, of Chicago, was removed, and early in 1906 the remaining portion of the briquetting plant was destroyed by fire. In rebuilding the plant provision was made for the installation of a Renfrow briquette machine.

This machine was completed in the fall of 1905. Mr. C. T. Malcolmson, of the United States Geological Survey testing plant, inspected this press at the shops of the Ramming Machine Company, at St. Louis, and burned some of the briquettes under a boiler at that plant. Difficulties were developed from the fact that the fuel remained too long in the vertical heaters, and some trouble was also experienced in getting the material from the die-filler to the die proper. Occasionally briquettes would stick in the dies, resulting in a double charge, which finally crippled the machine. Provisions were then made to overcome these difficulties and the machine was rebuilt. The new machine was first tested in March, 1906. The heating capacity was increased so that the charge remained in the conveyors about 15 minutes before reaching the dies, thus allowing the material to become thoroughly heated and the melted pitch to mix with the coal. Brushes were added to insure the charge being carried to its proper position in front of the die, and an ejector, operated by a magnet, insured the delivery of the briquettes from the ends of the plungers. Many of the parts of the machine were strengthened, and steel and bronze substituted for cast iron in the wearing parts.

[12] *U. S. Geological Survey Bulletins* Nos. 261 and 290, and *Professional Paper* No. 48.

The results of the tests on this machine, made under the supervision of Mr. Malcolmson for Mr. J. A. Holmes, expert in charge of the St. Louis fuel testing plant, at the testing plant of the company, resulted in a contract for the rental of this machine by the Government. In May, 1906, the first successfully-operating Renfrow machine was installed at the fuel testing plant. It is shown in Fig. 13.

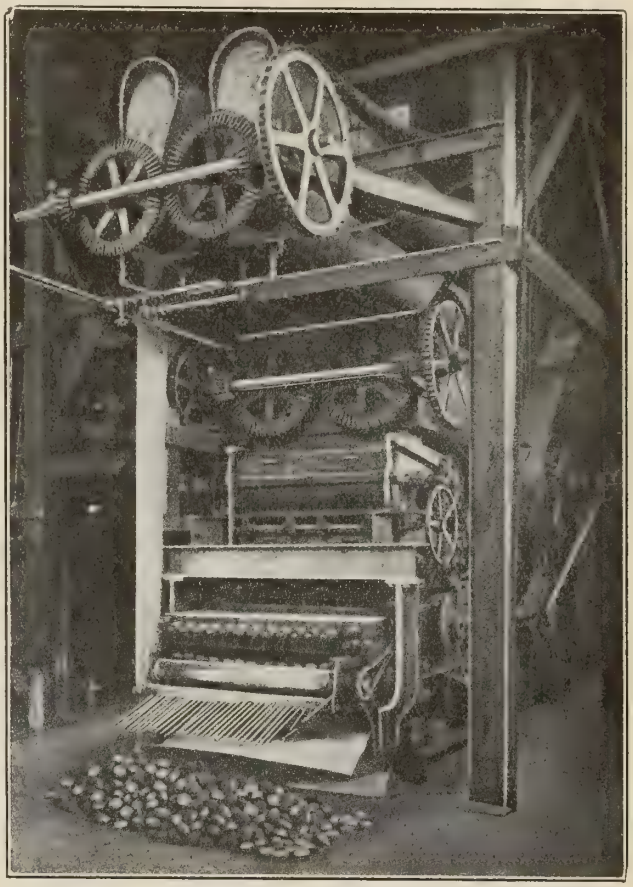

Fig. 13.—Renfrew Briquetting Press.

The result of the tests which have been made on the Renfrow machine from May, 1906, to March, 1907, indicated that the design of this press was, in the main, satisfactory, and that the difficulties experienced were due almost entirely to bad or weak construction of the machine. This machine was the result of many changes, while in many cases it was impossible to strengthen the weak parts owing to the limited space, or the fact that the size of the part was fixed by the original design.

The difficulties encountered in operating this machine at the coal testing plant soon indicated its weaknesses, and as a result the Renfrow Co. designed and built two new presses, one of which was installed and is now being operated by the Western Coalette Fuel Company at Kansas City. The other is now ready for delivery to the fuel-testing plant at the Jamestown Exposition. The new press makes a briquette 3.25 inches in diameter, weighing about a pound. The machine which was operated at the St. Louis fuel-testing plant could not be depended upon to deliver more than 1,000-lb. pressure per square inch on the briquetes without seriously straining the frame of the press. The new machine will deliver a maximum pressure of about 2,500 lb. per square inch without straining the machine. All of the wearing parts not under pressure are made of bronze so as never to become corroded, while the dies are made of

case-hardened steel, which, owing to the abrasive action of fuel, are kept clean and bright. The cams and rollers, originally made of chilled cast iron, are made of case-hardened stool steel in the new machine, and the design of the housing has been so changed that any of the parts can be removed without dismantling the machine. Provision has also been made in the new machine so to feed the heaters that they will always run clean and at the same time keep a full load in the chamber above the die filler. This chamber, while closed in the old machine, is open in the new, which allows the operator to regulate the supply of fuel to the press at all times.

(To be continued.)

PERSONAL AND GENERAL

Mr. J. J. Fingland, of Glasgow, Scotland, has opened assay offices at Sandon, B.C.

Mr. A. J. Goodell, superintendent of the Le Roi Company's Northport smelter has tendered his resignation to the directors.

The Mining Journal congratulates Mr. J. La Barthe, superintendent of the Trail smelter, on his recent marriage. Mr. and Mrs. La Barthe are now enjoying their honeymoon.

The Hon. Jean Prevost, Minister of Colonization, Mines and Fisheries in the Quebec Government, resigned his portfolio at a meeting of the Provincial Cabinet on September 30th.

Dr. Frank D. Adams is expected to arrive in Montreal from England this week. During his stay in London Dr. Adams was in attendance at the meetings of the Royal and Geological Societies.

Mr. T. Hayes-Sheen and Mr. H. J. Carnegie-Williams left Bruce Mines late in September. Both these gentlemen are visiting England in connection with the acquisition of an Elmore vacuum installation at Bruce Mines.

Mr. J. D. Kendall, the distinguished mining engineer of London, England, arrived in Canada on the 6th of October on a visit to his son, Mr. Cosmo Kendall, who is operating the Bell mine, a graphite property near Buckingham, Que.

Mr. R. R. Hedley expects to complete the work of collecting information on the mining and metallurgical industries of British Columbia for the Dominion Government by the end of the year, when he will go to Ottawa to prepare his report.

Mr. H. H. Claudet, of Rossland, representing the Elmira Company, is absent in Califoria, where he is spending his honeymoon. Mr. Claudet has contracted to supply three plants to treat ore by the new Elmore vacuum-oil process in British Columbia.

In consequence of the increased activity in the Omineca district of British Columbia, the authorities have decided to re-open the Government offices at Hazelton, which will be placed under the direction of Mr. F. W. Valleau, who has been appointed gold commissioner.

Advices from Ottawa state that the Deputy Minister of Mines, Mr. A. P. Low, is rapidly recovering from the effect of the slight relapse which he suffered while in the West, as a result of over-taxing his strength there. He is, however, recommended by his medical adviser to take a complete rest and it will, therefore, be some little time before he will return to his duties.

The following gentlemen were elected to membership in the Canadian Mining Institute at a Council meeting held on Saturday, October 5th:—

Corresponding Members:—Mr. M. Walton Brown, secretary of the North of England Institute of Mining Engineers; Mr. Bennett F. Brough, secretary of the Iron and Steel Institute; Dr. Wm. Campbell, Columbia University, New York; Dr. J. F. Kemp, Columbia University, New York; Dr. A. C. Lane, State Geologist, Lansing, Mich.; Dr. C. K. Leith, Madison, Wis.; Mr. C. McDermid, Secretary Institution of Mining and Metallurgy; Dr. R. W. Raymond, Secretary, American Institute of Mining Engineers; and Dr. C. R. Van Hise, President Wisconsin University, Madison, Wis.

Members:—J. W. Astkey, Victoria, B.C.; C. S. Baker, Box 123, Greenwood, B.C.; P. McN. Bennie, Niagara Falls, N.Y.; Charles Biesel, Phoenix, B.C.; W. B. Bishop, Grand Forks, B.C.; L. L. Bolton, Lake Superior Corporation, Sault Ste. Marie, Ont.; Cecil M. Bryant, Vancouver, B.C.; James Buchanan, Trail, B.C.; Lorne A. Campbell, Rossland, B.C.; Nicholas J. Cavanagh, Nelson, B.C.; Thomas W. Cavers, Rossland, B.C.; Andrew Colville, Coal Creek, B.C.; R. C. Campbell-Johnston, 1171 Melville street, Vancouver, B.C.; Dr. Fritz Cremer, South Works, Ill., Steel Company, South Chicago, Ill.; Paul S. Coldrey, Rossland, B.C.; J. K. Cram, Rossland, B.C.; Graham Cruickshank, Rossland, B.C.; W. S. Drewry, Nelson, B.C.; G. W. Dunn, Box 493, Rossland, B.C.; Jacob M. Eggert, New Liskeard, Ont.; Newton W. Emmens, Trout Lake, B.C.; J. B. Farquhar, Dominion of Canada Assay Office, Vancouver; James Findlay, 1428 Robson street, Vancouver, B.C.; A. L. Fowler, Cobalt, Ont.; S. N. Graham, Mina El Favor, Hostotipaquillo, Jalisco, Mexico; R. H. Hewer, Greenwood, B.C.; Lewis Hind, Three Forks, B.C.; A. C. Horton, Cobalt, Ont.; Alexander Kaye, Box 1253, Vancouver, B.C.; A. G. Langley, Box 827, Vancouver, B.C.; O. E. Le Roy, St. Andrews East, P.Q.; James Lockwood, Edmonton, Alta.; George W. McCaskell, Cobalt, Ont.; C. H. McDougall, Phoenix, B.C.; W. D. McGrege, Victoria, B.C.; M. D. McIntosh, Greenwood, B.C.; A. L. McKillop, Nelson, B.C.; W. S. St. J. Miller, Box N., Grand Forks, B.C.; Chas. T. Mitchell, Box N., Grand Forks, B.C.; J. O'Sullivan, 432 Richards street, Vancouver, B.C.; Francis J. Peck, 531-5 Williamson Building, Cleveland, O.; M. E. Purcell, Rossland, B.C.; John Redington, Cobalt, Ont.; Frased D. Reid, Cobalt, Ont.; John F. Robertson, Greenwood, B.C.; Chas. Rundberg, Phoenix, B.C.; James Rutherford, Victoria, B.C.; J. M. Sands, Box 776, Rossland, B.C.; Chas. D. Smith, Box 361, Cobalt, Ont.; O. B. Smith., Jr., Phoenix, B.C.; M. H. Sullivan, Trail, B.C.; Clifford Varcoe, Greenwood, B.C.; E. H. Vaughan, Box 334, Grand Forks, B.C.; Julius H. Warner, Haileybury, Ont.; E. W. Widdowson, P. O. Box 1108, Nelson, B.C.; Wakelev A. Williamson, Grand Forks, B.C.; Franklyn Wilson, Greenwood, B.C.; E. B. Webster, Greenwood, B.C.; L. P. Burns, 478 Front street west, Toronto, Ont.; Lee J. Lockwood, Cobalt, Ont.; Francis N. Flynn, Cobalt, Ont.; Le Rocque, Labelle, P.Q., P. O. Box 826, Montreal, P.Q.

Associate Members:—G. O. Buchanan, Kaslo, B.C.; E. Cave Browne-Cave, P. O. Box 355, Vancouver, B.C.; F. W. Chalmers, Cobalt, Ont.; Gerald Chown, 20 Barrie street, Kingston, Ont.; Martin Cohn, Care McGiverin & Haydon, Ottawa, Ont.; J. W. Collis, Care Mussens, Limited, Box 818, Vancouver, B.C.; Smith Curtis, Rossland, B.C.; A. C. Flennerfelt, British-American Fruit Company, Victoria, B.C.; Harvey D. Graham, Haileybury, Ont.; J. T. Hillis, Box 1028 Vancouver; S. H. Logan, Canadian Bank of Commerce, Cobalt; William Pitkethly, Heaslip, Ont.; Duncan Ross, Greenwood, B.C.; H. E. Wade, Box 716, Nelson, B.C.; E. W. Wauk, Nelson, B.C.

Student:—John N. Morrison, Glace Bay, N.S.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.—Things are going along very nicely around the collieries just now. The labor situation is distinctly easier, more from the fact that the men as a whole are working better than from any influx of labor. The output of the Dominion Coal Company's mines for September will be about 300,000 tons. October will in all probability have the heaviest tonnage of the year. Somehow October is always a banner month in the matter of outputs. Perhaps it is that the miner begins to realize that the harvest is past and the summer ended, or in other words that picnic time is over and that he will want a little saved for the winter. It is a strange thing that the same men that will resist bitterly the reduction of a single mill in their price list will yet lose weeks of valuable time summer after summer, to their own sure detriment and loss did they but realize it. The fable of the grasshopper and the ant has still its application in Cape Breton collieries.

The Dominion Coal Company are now actively engaged in preparing a site for their new colliery on the areas that lie between Low Point on Sydney Harbor and the anticline that is supposed to run concurrently with Briddgeport Basin. The new mine will be known as "Dominion No. 12," and will be a slope mine on the Victoria Seam. This seam has a great reputation locally, and was in much demand when the old Victoria Mine was working. A branch line will be constructed of about seven miles in length to connect the new mine with the Sydney & Louisburg Railway at a point near Grand Lake. In all probability the branch will be completed for the shipping season of 1908. The officials' houses and a number of workmen's dwellings will be erected before the winter sets in. Two slopes are now commenced, and the work of driving will be actively prosecuted throughout the winter, for which purpose a temporary plant is now being installed.

In what are generally known as the Lingan-Victoria areas the Coal Company have a property the value of which is not generally realized. The coal exposure is one of the finest in existence, showing as it does the crop of five workable seams, three of them over seven feet thick, for a length of seven miles or more. The crops are admirably adapted for slope mining under the most favorable circumstances. As yet the most valuable portion of the Coal Company's properties is practically untouched.

The steamer "Cabot" is the latest addition to the Black Diamond fleet. She arrived here on the 20th after a stormy voyage across from her builders, the Grangemouth & Greenock Dockyard Company of Scotland. The "Cabot" is not a very large boat, being about 150 feet over all, and drawing only 12 feet of water. She is intended for small ports trade. She is happily named, the matter of nomenclature being one in which the boats of the Black Diamond line excell, as witness the "Bonavista," the "Catalone" and the "Louisburg," all of which have an old time smack that is good to hear. It is amusing to hear a Cape Bretonian from "way back" or a newcomer from the "Bruce" trying to get his tongue around words like "Borgestad," "Drottning Sophia" or "Fimreite."

The Dominion Government recently passed an Order-in-Council remitting to the Dominion Coal Company the sum of $1,380, being the duty and German surtax paid on the recently imported Draeger life-saving apparatus. One of these apparatus is at present on exhibit at the Provincial Exhibition at Halifax.

Glace Bay and the collieries are still chuckling over the remarks of the Hon. Rubert Drummond in the "Mining Record" on udge Longley's decision in "Steel vs. Coal." His remarks on laminations and layers are particularly illuminating. The "Hon. Bobby," as Mr. Drummond is usually called, cannot see how No. 6 coal could be "commercial coal, well picked," and at the same time "not reasonably free from stone and shale." So far Mr. Drummond is the only writer who has dared to record a protest against the findings of the learned judge, and to the Glace Bay people at least his dissertations are distinctly refreshing.

The following appeared recently in one of the Halifax dailies, and is good enough to quote: "If twenty years ago I had the moral courage to fling away the joys of office, I might have made the world happier and better," said Judge Longley at General Booth's meeting. It is not too late yet for Mr. Justice Longley to go into the Army. The Dominion Coal Company would probably be willing to advance sufficient to buy him a bonnet and tambourine. We daresay they would.

The P. W. A. at their recent meeting in Halifax decided to petition the Government against the use of disc and chain coal cutters in pillar work, urging that they are dangerous in use and make no noise as to drown the "talking" of the roof. A good many pillars have been drawn in Cape Breton recently which have been undercut by these machines, and we have not yet heard of an accident due to their use. We do not think the objection of the P. W. A. is well taken. It is an objection that has been urged time and time again in the mines of the British Isles, but an objection which is now pretty well exploded. The miner who depends entirely upon the "talking" of the roof for his danger signal is running things too closely, and we fail to see why undercutting by machine should be any more dangerous than undercutting by hand. Pillar work in the Cape Breton mines is exceedingly well paid, and there is considerable competition among the miners for places in the pillars with the "little pick." One had thought, however, that this time-worn objection to the mechanical coal cutter had been relegated to oblivion along with the objections made to the spinning mule and the steam locomotive, but such notions die hard.

Labor unions throughout Canada appear to be disturbed over the problem of Asiatic labor, and the P. W. A. also drafted a resolution against the importation of labor of this character. At Winnipeg recently the Trades Congress protested against the importation of skilled European labor. We wonder whether the trades unions of Canada think the commerce of this Dominion can be carried along by the present working population of Canada, and whether this great and growing Dominion can be a close corporation. Laboring men are needed in Canada. They are needed to-day in large numbers, but to-day's needs will be eclipsed and forgotten in to-morrow's greater needs. For the working classes of Europe Canada is now "God's Country," a title to which our southern neighbors are fast losing their right. Any attempt on the part of any body of men to restrict the present rate of emigration to Canada can only hinder the progress of our commercial prosperity, and for this reason will almost necessarily be an abortive attempt. As we see it "it is up to" the Canadian workman to see that he becomes the patrician in the ranks of labor in the Dominion, that from out of the influx of foreign labor he wrests promotion and advancement for himself. His are the rights of patrimony and primogeniture, and if he plays his part well, no one can take them away from him.

We suggest to some of the labor unions of this Province that instead of fighting the chimera of Asiatic immigration they enquire why it is that when a capable superintendent is required for the Steel Works he has to be imported from Alabama, U.S.A., or from across the water, and why so many lucrative positions in both mines and steel works are being filled by men who have the necessary technical and theoretical training gathered in other parts of the world. The Nova Scotian Government are patting themselves on the back because they contemplate the expenditure of $100,000 on technical education, and truly this is a beginning. Only a beginning, however. Over $400,000 per annum is spent in Cape Breton for "rum." The Sydney Town Council offered to give $400 to technical education as represented by the Cape Breton Technical School last winter. They collected a lot more than

this in Scott Act fines. Charity begins at home, they say. Asiatic labor in Cape Breton is a pipe dream, a bogie to scare children with, but there are real evils to be fought right here. One is "rum," the other in plain English is ignorance. This may be strong language, but unless the native miner wishes to become the helot of the newcomer he must be afforded and take advantage of the opportunities for self-advancement and technical study that are so freely offered both in Europe and in the United States. Almost all the theoretical and technical knowledge among the lower officials in this Island was despatched from Scranton, U.S.A. That is to say, the portion of it which was assimilated. All of it was paid for, and it would be an interesting thing to know just how much money had gone across the border for correspondence lessons that could very well have been expended this side of the line.

The Commission to enquire into Relief Societies at the collieries and the matter of Old Age Pensions finished its labors in Glace Bay last week. A considerable amount of evidence was taken, which will doubtless form the subject of a Government publication. Old age pensions appear to be in the air just now, for much is being said and written on them both here and over in England. We do not think, however, that old age pensions exactly appeal to the more deserving classes of the British Empire, particularly those who reside in Canada. Over here we appear to have absorbed something of the aggressive individualism of the United States, where they are said not to need such pensions, because at sixty a man has either made his "pile" or is dead. However this may be, we cannot see why miners as a class are any more deserving of old age pensions than other classes in the community. We grant that as a rule they live longer, but why they should be entitled to special consideration in this matter is not quite apparent. There are trades fully as hazardous as the miner's and not half so well paid, as for instance, the deep sea fisherman, the alkali and cement worker, the steel worker, and the railroad man. If, however, old age pensions ever become an accomplished fact in Nova Scotia, there should be no large Governmental grant, and no suspicion of charity about it. Compulsory payment by a prospective beneficiary from a certain age, say 20 to say 50 years of age, or in other words the purchase of a guaranteed annuity by compulsory instalments is the only equitable and workable basis on which old age pensions can be obtained. We do not imagine that the average Canadian is much exercised on the subject of old age pensions. Life is too short.

The Dominion Coal Company have made somewhat of a departure in their management organization under a circular issued this week. Mr. Peter Christianson, who has for a long time been the assistant superintendent of mines, is now appointed mines superintendent of district No. 1, which comprises collieries Nos. 1, 8, 5 and 10, and Mr. Norman McKenzie, for some time past the manager of Nos. 2 and 9 collieries, is appointed mines superintendent of district No. 2, comprising collieries Nos. 2, 9 and 7. Each of the collieries named will have its own manager. In creating this new office of district superintendent the Coal Company have opened up a new avenue of promotion for their managers, and we think the appointment will give general satisfaction.

ONTARIO.

COBALT.—The Coniagas concentrating mill is in full operation and is proving a decided success. It consists of Blake crushers, three jigs, a Huntington mill, one Wilfley table and two Frue Vanners, the total capacity of the mill being 100 tons a day. Mr. Fraser Reid, formerly of the Canada Corundum Company, Craigmond, is in charge of operations.

The Buffalo mines are constructing a similar mill and expect it to be in full operation in a few weeks.

The Nova Scotia have installed a new compressor. Some very rich ore is being mined here, their new discovering having proved to be regular bonanzas.

The strike, to all outward appearances, is a thing of the past. All the mines are operating in full force and men seem plentiful. Organizer Roadhouse's appearances on the Square are growing scarcer since his following has diminished to a few men, who seem to enjoy his peculiar style.

A widely signed petition is being circulated among the citizens of Cobalt to prevent the reckless blasting by the mining companies and railroad contractors. It is to be hoped that some means will be taken to prevent this unnecessary danger, whoever is to blame, the miners or the railroad workers.

The Kerr Lake mine is constructing a large number of buildings, including one of the finest sleeping camps in the district. A commodious engine room has just been completed, and a new compressor installed. There has been remarkable progress made on this property during the past few months.

A remarkably rich vein of calcite, smaltite and native silver was discovered on the Silver Leaf property last week. It is fully 18 inches to 2 feet in width in some places. The discovery was made while trenching.

The City of Cobalt uncovered a couple of rich veins last week. This property is showing up well under systematic development work.

Mr. Wm. Nicol, Professor of Mineralogy at Queen's University, has returns to Kingston after a visit of some weeks in the camp, where he has been gathering specimens for the Department of Geology and Mineralogy at the University. Prof. Nicol spent the early part of the summer in Germany.

Mr. Barnett, M.E., of London, England, is at present in the camp, representing British capital.

Thos. Burkett, M.P., of Ottawa, director of Cobalt Lake Mining Company, also the City of Cobalt, was in town last week.

J. M. Clark, K.C., Toronto, spent a few days in camp last week.

A remarkably large vein of cobalt and silver has been struck on the Temiskaming & Hudson Bay property. This property adjoints the Trethewey, and, during the summer development work has shown it to be a bonanza property.

The concentrator at the McKinley-Darragh is now in full working order. The crushing is done by a stamp mil land concentrated by vanners. It has proven so successful that the company intend to put in another twenty stamps. This property, under the management of Capt. Harris, has been making remarkable progress.

The O'Brien mine is installing a new power plant. The boilers are already in place and they expect to have their twenty drill compressor at work very soon. They are also installing a new electric plant.

ALBERTA.

CANMORE.—The H. W. McNeill Company, of Canmore, Alberta, are opening up a new vein of coal on the eastern side of their property. This vein, known as the Sedlock vein, was prospected several years ago and found to be a good steam coal. Owing to the present great demand for steam coal, the company has thought it advisable to develop this new vein and increase their present output. About 200 men are at work on the spur line, which runs from the main C. P. R. track to the tipple at the Sedlock mine. This spur line is a little over one mile in length and of a good grade throughout, although the cutting in hard limestone rock is at some points very heavy. It is expected that the steel will be laid in a few weeks, by which time the large staff of men employed building the mine tipple will have completed their work. It will be some time, however, before a large output can be expected, as the mine workings have all to be opened out, nothing having been done inside the mine except the driving of a few trial drifts.

HILLCREST.—The Industrial Disputes Investigation Act has been brought into force at Hillcrest, Alberta, where there is a dispute between the Hillcrest Coal Company and the United Mine Workers of America regarding the wages to be paid miners. President

F. H. Sherman of the U. M. W. A. is representing the men, and Mr. John R. Macdonald is representing the Hillcrest Coal Company on the Arbitration Board. The board having failed to agree on a chairman, the Minister of Labor has appointed C. W. Fisher, Speaker of the Alberta Legislative Assembly, to act as chairman.

MORINVILLE.—The following resolution, passed by Morinville Miners' Union, has been forwarded to Sir Wilfred Laurier:

Whereas the time has arrived in the history of Canada when the Government must choose between an Asiatic or a Canadian British Columia;

And whereas the present influx of Asiatics into the Province of British Columbia must inevitably lead to constant clashes between the two races, resulting in rioting, destruction of property and murder;

And whereas this state of affairs threatens the solidarity of the Dominion, and must result ultimately in the secession of British Columbia or war with Japan;

And whereas it is the working man who is called upon in the time of war to bear the brunt of the fighting, and it is labor that backs every fund for the repayment of expenses incurred by war;

And whereas war is hell;

And whereas it is the belief of the working men of Western Canada that these unassimilable alien races are being allowed to enter Canada to suit the convenience of railway corporations, lumber operators, and other trust concerns;

And whereas now it is a matter of choice with the Dominion Government whether they should decide with Canadian working men and peace or with the corporations for an Asiatic British Columbia and ultimate war;

Therefore be it resolved:

That the Morinville Miner's Union, No. 2378, of the U. M. W. of A., regard as a national menace the delay of the Dominion Government in the face of such a crisis, and as citizens of Western Canada we call on you, Sir Wilfred Laurier, your Cabinet and the Dominion Government to take immediate action to avert a national calamity by passing an Absolute Asiatic Exclusion Act which will for all time preserve Western Canada to the white race, and this resolution is passed with the full knowledge that the ever-ready argument of "Imperial" reasons might be brought forth to answer this, as it has served to answer other and similar resolutions, but with this fetich we have little patience and less faith.

The Morinville mines are situated about 20 miles north of Edmonton and employ about 60 men underground. The output is 400 tons per day. This camp has been "organized" by the U. M. W. of A., and has now been a "union" camp for about four months.

EDMONTON.—The men employed by the City Coal Company, Edmonton, have been organized by Organizers Patterson and Galvin of the U. M. W. of A. Twenty men are employed in the City Coal Company mine, and all have joined the union.

BRITISH COLUMBIA.

FERNIE.—Senator Cox, of Toronto, president of the Crow's Nest Pass Coal Company, Limited, interviewed at Vancouver, B.C., emphatically denies the report that G. G. S. Lindsay, K.C., general manager of the Crow's Nest Pass Coal Company, is about to retire from his position with the company.

Rev. Hugh. R. Grant, late of Fernie, B.C., now of Pincher Creek, Alta., has been appointed chairman of the Joint Committee of the Western Mine Operatorss' Association, and the United Mine Workers of America. The reverend gentleman was very popular amongst the miners while stationed in Fernie, and his appointment as chairman of the Joint Committee meets with general approval from all interested in mining matters.

HOSMER.—The Hosmer Miners' Union has applied for a Board of Investigation under the Industrial Disputes Investigation Act, and their application having been favorably received the Board has been formed. President F. H. Sherman, of the U. M. W. of A. will act on behalf of the men, while Frank F. Smith, mining engineer, of Edmonton, will act on behalf of the Hosmer Mining Company. The chairman of the Boar dis Judge Wilson, of Cranbrook, B.C.

THE KOOTENAYS.—Conditions in this district during the past couple of weeks have been very satisfactory. Things are really a little quiet at present, and those who speak for the various industries lay the cause to the coke and fuel shortage, scarcity of money, the fall in the price of copper, etc. Many of the mining shares have taken a marked slump, some of the mines have reduced their working forces, and the demand for lumber and telephone poles has fallen off to a considerable extent.

Trouble between the miners at Lethbridge and the coal mine operators has come to the surface again. It is the same old story. The men want their time to begin when they take up their tools and start for the face, while the operators claim that the day's work begins when the men arrive at the face of the workings. The miners also complain that the machinery is started about ten minutes ahead of time and left running until ten or fifteen minutes after quitting time, and it is imperative that they remain at their posts until the machinery stops to avoid breakages and accidents. The men are working ahead and the affair will be arbitrated if both parties can agree o na board, which they are haggling over at present.

There is quite a scarcity of coal miners along the Crow's Nest. The Crow's Nest Pass Coal Company and the Canadian-American Coal & Coke Company have had to look into outside districts for men. About forty miners recently came from England to work for the first mentioned company, and Manager Moore of the latter corporation has been to Montana in search of help, but finds that men are more scarce there than in the Crow's Nest district.

The Great Northern has a force of men engaged in making a permanent location of the Great Northern line up the Elk River from near Michel. This railway, from Fernie, B.C., to Calgary, Alta., will traverse rich coal fields all along its line. The grade is less than one per cent. The surveyors will try and carry their work as far as the summit between the headwaters of the Elk and Kanakaskis Rivers, an elevation of about 6,500 feet, before the weather conditions make it impossible for them to go farther. About 800 men are now at work on the grading and bridge work for part of the road from Fernie to Michel.

The St. Eugene mine, of the Consolidated Company, has entered into a contract with European buyers for part of their output of concentrates.

The Hewitt mines, near Silverton, which is owned by New York interests, now has 35 men on the pay roll and about 60,000 tons of ore blocked out. On a car of ore recently sent to Trail smelter good returns were realized.

Matters are looking a little brighter in the Slocan. It is rumored that an important strike was recently made at the Westmount mine on Slocan Lake. They are diamond drilling at the Arlington and they are working again at the Ottawa.

The Rossland mines are shipping every day and while things are quiet the industry is in a healthy condition. Mr. F. W. Warren, of White Bear fame, was in the city recently, and reports that affairs with the White Bear mine are looking better.

In the Boundary, the Dominion Copper Company is thinking of enlarging its smelting capacity. They can at present treat about 1,200 tons of ore per day. For the week ended September 28th the Granby shipped 23,000 tons of ore. This is the greatest quantity they have ever shipped in a week. One day they shipped over 4,000 tons. The total shipments from Phoenix for that week were 41,000 tons, which made a new record. So it will be seen that the mines of this district are still shipping a rather bulky tonnage, despite the fact that many of the copper producers in

the United States have cut down their production almost as much as fifty per cent. in some cases.

This is an age of arbitration. Now the Crow's Nest Pass Coal Company and a Government nominee, J. A. Mara, are going to select a third arbitrator between them, and the three will thresh out the coke shortage proposition. It is to be hoped that their efforts will result in more fuel.

It is understood that an agent for the Orientals on the coast has been making overtures to the Boundary mining men and the coal operators of the Crow's Nest district towards furnishing them with cheap labor to operate their mines. Feeling is still running high throughout this country against Asiatic immigration in unlimited numbers, and it is hoped and trusted that the Government will find some means of checking this yellow stream.

Granby shareholders will soon be receiving cheques for the eighth dividend of that company, amounting to $3 per share, or a total of $405,000 for the 135,000 shares issued. During the fiscal year ended June 30th last the Granby Company produced about 20,000,000 pounds of copper and realized somewhere about 22 cents per pound for it.

KOOTENAY.—Although there is a tightness of money for investment, and mining stocks in common with others have undergone a severe reaction, there was probably no time in recent years when more capital is seeking bona fide investment in the mines of Kootenay than the present. In the Big Bend country, to the north of Revelstoke, three hydraulic properties have employed a considerable number of men this season. The Revelstoke and McCullough Creek Company have taken out a quantity of gold. The French Creek hydraulic property is being operated by Mr. Vance on behalf of Mr. Hoover, a mining investor of Indiana. Pittsburg people are putting in a hydraulic plant on Smith Creek, the work being done under the supervision of Mr. Guffy.

Spokane parties had an option on the Downie Creek copper properties, but after spending a good deal in opening up the trail to the ground they have thrown up the option without having done any development work on the property.

The Standard mine, in the Big Bend, is a copper property which has been developed to a depth of 550 feet, but is at present shut down for want of funds.

Development work is being pushed on the Lightning Peak properties at the head of Fire Valley, and the first shipments of ore from this camp will be made this winter.

Spokane parties have been up examining the Big Ledge, a large low grade zinc property on Pingston Creek, and tributary to upper Arrow Lake.

At Rossland the mines never looked better. The Le Roi, Le Roi No. 2, War Eagle, Centre Star, and White Bear are working steadily and shipping. The Le Roi Company have now completed their five compartment shaft to the 1,650 foot level, and have cross-cut the ore body there for 30 feet, besides drifting on it 150 feet each way. There is a fine showing of ore on this new level—the lowest in the mine. As the ore body is not yet cross-cut from wall to wall its width is unknown.

The north vein on Le Roi is now developed to the 300 foot level, and contains the ricehst ore yet found in the mine.

The new company organized to operate the California and Giant art pushing development work on both properties with every prospect of success. The ore bodies in Le Roi No. 2 have now been developed to the boundary of the California, and as the ore continues strong and of good values in the face, the new company, which is composed mainly of the original founders of the Granby, begins its operations under most promising auspices.

Scotch capital has become interested in a copper-gold property in South Kootenay, where there is a large quantity of ore in sight, and should future development warrant it the intention is to add a smelting plant.

The Trail smelter has had two copper furnaces shut down owing to want of coke, but the situation is improving. This smelter continues to make big improvements to meet the increased mineral production of South Kootenay, and is adding a number of Hebberlein roasters to those already in use. The lead refinery is being extended, and the lead pipe manufacturing branch of the business turns out a large quantity of piping of first-class quality. This industry is a great credit to Canadian enterprise.

Things are looking up in the Slocan. New capital is coming in. The profits made by leasers have had the effect of throwing new life into this well-known camp. Old properties are being re-opened and new ones are being developed.

The Blue Bell mine, being operated by the Canadian Metal Company on Kootenay Lake, is showing an immense body of ore. A new mill is being completed, and the mine put in shape for a large output. The mine will start shipping next month.

Poplar Creek, which a few years ago created a sensation by the immensely rich gold specimens produced in the camp, is again attracting attention. New York parties are developing the Calumet and Hecla on Rapid Creek with great success. John Keen, of Kaslo, is developing a property on the hill behind the town. Boston people, under the management of E. Mobbs, have taken up the Smith and Rogers property at Poplar Creek and intend putting in a stamp mill.

In the Lardeau, the Silver Cup, which has been a shipper of high grade silver ores for ten years, is looking better than ever. The mine is now developed to a depth of 800 feet. The ore averages an ounce in gold to the ton and nets $150 after payment of mining, transportation and smelting charges. A hoist was recently installed to sink a shaft with a view to testing the ground at depth before running another long tunnel, and a 30 drill compressor is now being installed.

The Ohio Development Company, which has been operating the Broadview mine at Trout Lake, has sold that property and is now erecting bunk houses and buildings with a view to starting operations on the St. Elmo, Blue Bell and True Fissure, which the company has recently acquired. This is a remarkable property, having 4 1-2 acres of low grade ore exposed on the hanging wall of the main vein with cross veins carrying high values. Considerable development work has been done on the Blue Bell claim of this property. It is intended to mine the higher grade of ore this winter and make some shipments to a smelter.

A deal is on for the Eva and Oyster-Criterion, two well-known free gold properties at Camborne. The idea is to consolidate them and equip them with a large mill. There is plenty of ore, but it is low grade, and successful operation i sa matter of reduction of cost of mining and milling. There is no question as to the quantity of ore, Lexington Mountain, where these mines are located, being traversed in all directions by gold-bearing veins having anaverage value of $5 per ton. The Eva mine is now doing remarkably well in the matter of costs, ore being mined by glory-hole methods and delivered to the mill for 45 cents a ton, and the milling is done at similar cost. A compressor plant has been recently installed in the Eva. Mr. racey, M.E., is entitled to great credit for his management of this property.

W. J. Butler, owner of the Lucky Jack mine, one Lexington Mountain, has arranged to put in a two stamp mill to assist in the development of the property.

The Silver Dollar mill has started running, but it was intended for gold ores, whereas development is proving the mine to carry silver-lead rather than gold values.

The Edward Baillie Syndicate, owners of the Mammoth, a high grade gold-silver property on Fish Creek, intend to put in an aerial tramway.

GENERAL MINING NEWS

NOVA SCOTIA.

ANNAPOLIS.—At the Torbrook iron mines the Springhill strike is being felt indirectly. The mines are suffering badly from shortage of coal. No doubt this will be remedied very rapidly. It is the intention of the Annapolis Iron Mining Company to develop power at Nictaux Falls, about a mile from their mines. The power will be transmitted to the mines electrically. The cost of power installation at the Falls is estimated roughly at $50,000.

SPRINGHILL.—Owing to the refusal of the miners to accept the award of the Board of Arbitration and to the consequent continuance of the strike, it is possible that the Nova Scotia Government will be asked to operate the mines of the Cumberland Coal & Railway Company, pending the settlement of the strike. The Town of Springhil lis suffering badly from the present inactivity.

Deputy Minister of Labor MacKenzie King visited Springhill on October 3rd and 4th. After discussing the situation with the workmen, Mr. King wrote to General Manager Cowans requesting him to give some assurance about the resumption of work and the filling of contracts for coal with the Intercolonial Railway. Mr. Cowans replied that the men had refused to abide by the decision of a legally appointed Board of Arbitration, and that the company could not, in the face of this, take any further action or make any assurances in regard to the contracts. Thus, unless the strike is settled, the I. C. R. will be forced to place a 60,000 ton contract in the United States.

ONTARIO.

WABIGOON.—The Paymaster Shaft has attained a depth of 300 feet. The plant is being added to, buildings are under construction and, below, the ore chute looks well.

SUDBURY.—Mine No. 1 of the Moose Mountain Iron Mining Company is putting out a large quantity of iron ore daily. The ore is stacked for shipment in the future. On mine No. 4 a diamond drill is being used for prospecting purposes. Under Superintendent Leach the settlement composed of the workmen's residences has assumed a neat and attractive appearance. Foundations are being laid for the installation of power plants and crushing machinery.

COBALT.—During the present month the directors of the Foster Cobalt Mining Company will issue a statement to shareholders showing the exact financial condition—proceeds from shipments and detailed information regarding the workings of the property. Shipments of ore have been maintained regularly, and it is expected that they will continue. Sinking on vein No. 5 has now reached a level of 140 feet, and drifting will be proceeded with in three directions, following the course of veins 5, 1 and 2. The property is thoroughly prepared for economical and satisfactory work throughout the winter, permitting development work and ore extraction to proceed concurrently. Shaft No. 6 has been closed, and all ore will be handled from shaft No. 5. Sinking on No. 1 has extended to forty feet. The assay office is just completed, and will be in operation within a week. A complete summary with plans above and below ground is nearing completion. Blue prints, kept up to date monthly, may be examined at the head office of the company after November 1st.

A four foot vein with mineral deposit in the vein eight inches and heavily shot with silver, is reported to have been struck in the Silver Leaf property. The find was made while laborers were prospecting about 450 feet from the main shaft.

Manager Lang of the City of Cobalt, reports the new vein to show about eight inches of ore averaging a considerable amount of silver to the ton.

A three inch vein of calcite, rich in native silver, was found last week close to the main shaft of the Solar Cobalt. The shaft is now down about 50 feet.

Rapid progress is reported in the erection of plant for the Cobalt Concentrators and also the Muggley concentrator.

Only two mining companies secured Ontario charters last week. One is capitalized at $2,000,000 and the other $600,000.

The T. & N. O. Railway will in future refuse to permit the loading and unloading of dynamite at Cobalt. A spur line is under construction by which all shipments of explosives will be sidetracked to a suitable storing place. No small quantities of high explosives will be handled by the railway.

The weekly bulletin of the Cobalt Lake Mining Company reports the north shaft down to 26 feet. The south shaft is now down 65 feet. Cross-cutting and drifting are being extensively begun.

The Cobalt Concentrators, Limited, are installing machinery in their new plant. Foundations are completed.

KINGSTON.—The Kingston & Pembroke Railway has just moved the first shipment of iron ore from the Wilzurn mines to Renfrew, whence it was shipped to Sault Ste. Marie. This is the first shipment of a hundred thousand ton contract. A new electric plant is being installed at the mine, so that men can work night and day. The Kingston & Pembroke will on November 1st have a special train and crew to do nothing but handle the ore, taking it from the mines to Renfrew. At present they are moving 250 tons a day, and when all the machinery is installed they will be able to load a train in one hour.

ALBERTA.

FRANK.—The Leitch Collieries, which owns the townsite, has at present a small office building up and Townsite Agent Radcliffe has his office built. Aside from a small residence for the mine engineer, there are no other buildings as yet, but four cars of lumber passed through Frank yesterday for Hamilton, and without doubt there will be much building activity almost at once. The C. P. R. is now engaged in putting in a side track for unloading supplies, the grading for the yards of the local coal company is in progress, and the company has its underground work in shape to begin shipping coal as soon as the yards are ready.

BRITISH COLUMBIA.

PHOENIX.—It is estimated that the Consolidated Mining & Smelting Company employes 1,500 men and pays in wages annually $1,750,000. The operation of its mining properties costs $3,500,000 annually, and its tax bill is $50,000.

VANCOUVER.—The Ikeda mine recently shipped 80 tons of ore to Ladysmith. One hundred and ten men are employed in the Ikeda and three tunnels are being driven. A tram line six thousand feet long connects the new wharf with the mines. The Ikeda copper ore carries about $5 in gold per ton in addition to its copper contents.

Mr. W. G. Trethewey, lately of Cobalt, has bonded a copper property near Collinson Bay, Moresby Island.

The Southern Cross Mining & Smelting Company has been organized for the purpose of putting up a smelter near Alberni. English capital has been interested.

BOUNDARY.—The ore output of the Granby Consolidated for the week ending September 28th was the largest on record. Twenty-three thousand tons of ore were shipped for the week, and in one day 4,000 tons were shipped.

EAST KOOTENAY.—At the meeting of the stockholders of the Sullivan Mining Company, in the last week of September, Manager Dedolph of the smelter advised that the company expend between $65,000 and $75,000 to increase the capacity of the smelter. He stated that the smelter should be increased from 100 to 200 tons. This would require three new roasters and 10 concentrators.

According to the annual statement of the affairs of the Sullivan Group Mining Company, given at the annual meeting, the operating profit of the company for the year ending August 31st, 1907, was $77,091.94. The bullion account due the company is $472,091.42, the bonds for which the company is liable amount to $400,000, the interest for which the company is liable to September 1st amounts to $6,22567, and the net gain to the company as a result of the year's work, after the payment of all interest, is $45,441.56. The receipts from the sale of bullion for the year were $374,286.74. The company has purchased the Big Dipper and Euphemia Fraction mineral claims, and has taken an option on the Commonwealth. The proposition to expend the above mentioned amount on the smelter was opposed by Manager Finlay of the Sullivan mine, who claimed it was unwise to expend much money in increasing the capacity of the smelter when the ore reserves were not known. He said the company did not yet know what it had below the 100 foot level, and he believed the company should sink a shaft another 100 feet in depth, so as to find if the ore continued at depth, before any such increase should be attempted. He said there was enough ore in sight to keep the smelter going at its present capacity for ten months or a year.

Rossland.—The coke supply is becoming much more regular. Five of the seven Trail furnices are in blast. Le Roi mine shipped 1,575 tons of ore to the Northport smelter during the week ending September 21st, and Le Roi No. 2 shipped 560 tons to the Trail smelter.

Coal Creek.—Another disaster occurred at Coal Creek mines by which one man met his death and another was seriously injured. A premature explosion in No. 9 mine is supposed to be the cause, but as usual in cases of this sort the affair is veiled in mystery. The name of the dead man is Peter Johnson. The wounded man's name is John B. Deballiste.

Michel.—A party of fifty miners arrived here from England last night to work in the mines.

The management of the mines expect to soon be working full handed.

They are, however, confronted by a serious situation, being unable to find boarding room for men already here. It was expected that the new boarding house just being completed would relieve the situation. However, accommodations are still inadequate. Every house in camp in filled. One cause is that very many of the miners have sent for their families during the past few months. As many as thirty families are now waiting for houses.

The only relief will be for the men to build houses themselves. In the new town many lots have been sold, but no houses are yet being built.

Nanaimo.—The dispute between the management and the drivers at the Nanaimo coal mines has been amicably settled. The men have gone back to work after four days' idleness. An agreement covering two years has been effected, making a 10 per cent. bonus a fixture.

Nelson.—The Kootenay Engineering Works has contracted to build a 1,000 ton ore bunker for the Hewitt Mining Company. It will be placed at the lower terminal of the tramway. A 300 ton bunker is being built at the upper terminal, near No. 6 tunnel.

MINING NEWS OF THE WORLD

GREAT BRITAIN.

The centenary celebration of the Geological Society of London opened at the House of the Institution of Civil Engineers, Westminster, on the 26th of September. The president, Sir Archibald Geikie, delivered an address on "The State of Geology at the time of the foundation of the Geological Society. In the evening of the same day the official dinner was held at the Metropole Hotel, while on the following evening the Geological Society Club entertained the foreign and colonial delegates at dinner at the Criterion Restaurant, followed by a conversatione at the British Museum of Natural History, South Kensington. The third and subsequent days were devoted to excursions to various centres of geological interest. Canada was represented at the convention by Dr. Frank D. Adams, of McGill University.

GERMANY.

The electrical production of steel is making much headway in Germany, where experiments with various types of furnaces are now being conducted. Recently the plant of the Rochling Iron & Steel Company, at Volklingen, was inspected by representatives of the iron and steel trade. Here a new type of furnace, founded upon a combination of the original Kjellin furnace, is in use. The furnace has a charge of three tons, and purifies a liquid charge from the basic convertor down to mere traces of sulphur and phosphorus.

FRANCE.

At the congress of miners of the centre of France, held recently at Commentry, one of the questions discussed was what attitude should miners assume in the event of ware being declared. Finally a resolution to the following effect was passed: "The National Federation of the Miners of France ought to respond to a declaration of war by a general strike." This in no wise discounts some of the unpatriotic utterances of certain anarchistic delegates to a labor convention at Winnipeg.

AFGANISTAN.

According to a report of a commercial agent of the United States Government, Afganistan is an extraordinarily rich mineral country. It is known to have mines of rubies, topaz, lapis lazuli, mable, iron, lead, copper, antimony, and other metallic ores, as well as sulphur and several of the earthly alkaline and metallic salts. Coal is also found. The lead, iron and precious stone mines are partially worked by the Government with modern machinery, but the mining of the country is mostly carried on by the crudest of methods and the bulk of the mineral wealth is not yet touched. The Amir continues to gradually purchase mining machinery as he has funds; but both Government and people are opposed to granting any concessions to foreigners.

SOUTH AFRICA.

The Legislative Council of the Cape has passed a bill imposing a profit tax of 10 per cent. on diamond and copper mining companies earning over £50,000 per annum, and providing that a defined dividend on preference shares in mining companies shall be taxed at the rate of two shillings on the pound.

The gold output of the Transvaal in fine ounces for the eight months ending August 31st is given as 4,226,470, valued at £17,952,905. This compares very favorably with the returns for 1906, which were 5,786,617 ounces, valued at £24,579,987. The production during August was a record achievement, the yield being 555,027 ounces.

It is stated that the replacement of Chinese in the mines by raw native recruits was adversely affecting working costs. Many of the Chinese are being repatriated against their will, and had even offered large sums of money to be allowed to remain in the country.

AUSTRALASIA.

The new Australian tariff places a rather serious tax on the mining industry in that the duty on mining machinery has been materially increased. Thus the old duty of 12 1-2 per cent. on mining engines and machinery has been increased to 35 per cent., with a preferential duty of 25 per cent. on articles of British origin. In nearly all materials used in mining a considerable increase in duty impost is also to be noted.

The gold output of the Commonwealth for the eight months ending August 31st was 2,083,863 ounces, or a decrease of 222,669

ounces compared with production for the corresponding period of last year.

Several new alluvial gold discoveries are reported to have been made recently in Victoria, and a nugget of 114 ounces has been found in the Poseidon field, which has resulted in reviving interest in the district.

NEW ZEALAND.

The Government of New Zealand is now offering a bonus on the production of marketable copper from ores mined and smelted in the country; and a bonus of four pence a pound on the production of the first one hundred thousand pounds of quicksilver, free from impurities, from any New Zealand mine. In respect to copper, the conditions are that if 1,000 tons are produced on or before June 30th, 1909, the bonus payable will be £1,000; after that date, £500 will be paid on respectively the second and third thousand tons produced.

UNITED STATES.

During the past two years and a half the productive capacity of iron furnaces in the United States has been increased to the extent of four million tons per annum, so that on July 1st of this year the actual productive capacity of the plants is about 27,700,000 gross tons per annum. Since that date still other furnaces have been blown in. For the first six months of this year the production was 13,478,044 tons.

The report compiled by the Minnesota Tax Commission, after exhaustive investigation, has developed the fact that the iron ore resources of the Lake Superior region are greater than a previous estimate. Thus in the Gopher State alone no less than 30,591 acres of iron lands, estimated to contain 1,135,000,000 (roughly) tons of ore, have been proved, the greater proportion being credited to the Mesabi range.

Several of the copper districts, in which the Amalgamated Copper Company have no interest, expect to benefit by the shut down of the Butte mines. This is especially the case in the Black Hills region, where recently some important strikes have been made. Meanwhile, already about fifty per cent. of the miners have been laid off in the Butte district, while the large copper concerns in Arizona have curtailed production very considerably.

The small electric smelter at Heroult, Shasto County, California, to which reference was previously made in this column, is now producing ferro-silicon at the rate of two tons daily. Directly the plant for making electrodes is completed the production of pig iron by electric smelting will be resumed.

The discovery of deposits of asbestos in the Province of Ilocos Norte, in the Philippines is announced. The mineral is found as a stockwork in the serpentine formation of the district. Two varieties of the mineral occur, namely, the true crysolite asbestos and tremolitic or amphibole asbestos.

Clarence Mackay has regained control of the Yellow Jacket mine, in Nevada, once owned by his father, John W. Mackay, who lost it to Robert Morrow many years ago. Morrow held on to it, and seemingly it was his for years to come. The Mackay interest in it was an unknown quantity and was not heard of until it suddenly asserted itself.

Commercial Note

The catalogue of Belliss & Morcom, Limited, has been received from their Canadian agents, Laurie & Lamb, 212 Board of Trade Building, Montreal. The catalogue is admirably illustrated with diagrams and engravings. The B. and M. patent self-lubricating, quick-revolution engines, direct, belt or rope driven. Their engines for electric lighting, power, traction and mill driving are the subjects of this catalogue.

Company Notes

A statement issued late in September by the Dominion Iron & Steel Company shows that its claim against the Coal Company amounts to $1,796,000. This is made up of $289,000 paid to the Coal Company in excess of $1.28 a ton, while the balance the company claims is damages.

STATISTICS AND RETURNS

Dominion Coal Company's output for September:—

No.	1907 approx.	1906 actual.
1	41,130	41,186
2	55,450	52,636
3	26,800	31,971
4	39,720	50,741
5	58,360	57,981
6	18,540	14,468
7	.....	12,028
8	19,700	23,271
9	28,800	34,420
10	8,500	5,031
	297,000	323,733
Shipments	287,150	333,779

Following are the ore shipments and smelter receipts in Southeastern British Columbia for week ending September 21st and year to date:—

	Week.	Year.
Boundary	41,493	882,078
Rossland	7,112	194,280
East of Columbia River	2,782	100,283
Total	51,387	1,176,641

	Week ending Sept. 28 Ore in pounds	Since Jan. 1. Ore in pounds
Buffalo	60,000	1,858,830
Foster	128,000	447,300
Nipissing	178,210	4,090,291

	Oct. 5. Ore in pounds	Since Jan. 1. Ore in pounds

Temiskaming	.....	229,011
University	.....	61,388

The total shipments for the week were 501,250 pounds, or 250 tons.

The total shipments since January 1, 1907, are now 18,955,820 pounds, or 9,477 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, vlaued at $1,473,196; in 1906, 5,129 tons, valued at $3.900,000.

The output of the Crow's Nest Pass Coal Company's collieries for the week ending September 27th was 19,439 tons, a daily average of 3,240 tons.

Following are ore shipments and smelter receipts in south-eastern British Columbia districts for the week ending September 28th, and for the year to date, in tons:—

	Week.	Year.
Boundary	32,098	964,176
Rossland	5,521	199,801
East of Columbia River	2,899	103,182
Total	40,518	1,217,159

The Cobalt shipments for the month of September were:—

Name.	Cars.	Tons.
La Rose	6	150
Coniagas	3	95
Buffalo	5	150
O'Brien	2	61
Nova Scotia	1	30
Foster	3	95
Silver Queen	3	90
Nipissing	5	167
A. A. Cole (sample)	1	9
Total	29	847

The output of the four collieries of the Nova Scotia Steel & Coal Company for the month of September amounted to 49,053 tons, as compared with 54,928 tons in August. The amount of shipping, however, from the company's piers has by no means diminished, as every pound of coal banked was used to supply the increasing demand. The figures for the different mines last month were as follows:—

Mine.	Tons.
No. 1	21,950
No. 3	20,600
No. 4	400
No. 5	6,103

The output from the new No. 4 colliery is not yet being shipped, as the railway connecting the mine has not been ballasted. When trains begin running to the new mine modern mining machinery will be installed.

The output of the Crow's Nest Pass Coal Company's collieries for the week ending October 4th was 20,692 tons, a daily average of 3,448 tons.

The United States will produce in the current calendar year approximately 27,000,000 tons of all classes of pig iron, which will compare with 16,497,000 tons produced in the year 1904, and 18,000,000 tons produced in 1903. The production this year will represent an increase of nearly 65 per cent., as compared with 1904, the largest increase reported in any similar period in the history of the iron and steel industry.

METAL, ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.
Antimony—10 1-4 to 12 cents per lb.
Arsenic, white—6 7-8 to 7 1-4 cents per lb.
Barytes, crude—$18 to $20 per short ton.
Bismuth, metal—$1.75 per lb.
Cadmium, metal—$1.50 per lb.
Carbons for drills—$70 to $80 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—25 to 40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$14 per short ton.
Flourspar, lump—$8 to $14 per long ton.
Graphite, domestic—$50 to $150 per ton.
Gypsum, lump—$7 per short ton.
Infusorial earth, ground—$20 to $45 per long ton.
Lead—4.75 cents per lb.
Manganese, pure metal—75 cents per lb.
Mica, ground—$50 to $80 per short ton.
Mica, scrap—$10 to $15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.
Nickel, metal—45 to 65 cents per lb.
Platinum, ordinary metal—$27.50 per ounce.
Platinum, scrap—$23 to $24 per ounce.
Pyrite—10 to 11 1-2 cents per unit for 38 to 45 per sulphur lump ore or fines.
Quicksilver—$40.50 per 75 lb. flask.
Sulphur—$19 to $23 per long ton.
Talc—$15 to $35 per short ton.
Tungsten, pure metal—$1.30 per lb.
Tungsten, ore, 60 per cent. pure—$9 per unit.
Tin—34 1-2 cents per lb.

MARKET NOTES.

Spelter.—Market has improved and displays strength. New York, 5.40 cents per lm.; London, £21.

Lead.—Production has been erstricted and lead holds its own at 4.75 cents per lb. New York; London, £19 5s for Spanish.

Tin.—Tin has declined markedly, and the market is weak. New York, 34 1-2 cents per lb.; London, £156 10s for spot.

Copper.—Copper is quiet. Consumers are still withholding orders. New York, lake 14 1-2 to 15 cents per lb.; eelctrolytic, 14 1-2; London, £61 15s for spot.

Silver.—Sept. 19th, 67 3-4; Sept. 20th, 67 5-8; Sept. 21st, 67 1-2; Sept. 23rd, 67 1-4; Sept. 24th, 67 1-4; Sept. 25th, 67 1-4; Sept. 26th, 67 3-8; Sept. 27th, 67 1-2; Sept. 28th, 67 3-8; Sept. 30th, 67 1-2; Oct. 1st, 66 7-8; Oct. 2nd, 66 3-4.

Mexican dollars, 51 7-8 cents; sterling exchange, $4.8575.

Pig Iron.—Pittsburg, Bessemer pig, $22.90; No. 2, foundry, $22.

Iron Ore.—Bessemer, old range, $5; Bessemer Mesabi, $4.75; non-Bessemer, old range, $4.30; silicious non-Bessemer, $2.50.

The output of gold in Rhodesia, South Africa, in August amounted to 54,749 fine ounces, against 50,127 last year.

WANTED

POSITION WANTED

Metallurgist (experience in West Australia, India and Johannesburg, South Africa, specialist in Milling and Cyaniding and Assaying) open for engagement.

"Randt,"
c/o Canadian Mining Journal.

MINING PROPERTIES WANTED.

Prospectors and others wishing to dispose of Mining Claims or undeveloped Mines in Ontario or Quebec, can communicate full particulars to the address below.

The properties will be examined by competent mining engineers, and if satisfactory, arrangements will be made to buy the same.

Address, General Post Office, Box 481,
Toronto, Canada.

I WILL GRUBSTAKE

PROSPECTOR and develop the find, if showing warrants. Don't waste your time writing me about ordinary opportunities; I'm deluged with such.

J. B. SPERRY, 18 BROADWAY, NEW YORK.

IRON AND PYRITES CLAIMS FOR SALE

Several undeveloped iron claims and several partially developed pyrites claims, within one mile of line of Canadian Northern Railway, 50 miles west of Fort William; and an undeveloped copper and silver claim near Nipigon, for sale.

Particulars P.O. Box 512, Fort William, Ont.

FOR SALE

Platinum in Commercial Quantity with percentage of Gold and Iridium, assays from 1 oz. 3 dwt to 1 oz. 15 dwt, test pit 5 ft. deep, value of ore increasing with depth; title in fee simple and unemcumbered; price $5000. For further particulars apply John J. Huxtable, 306 McIntyre Blk., Winnipeg

FOR SALE

Good mica claim—mica in paying quantity. Also two claims in Temagami, showing Cobalt bloom and giving good assay of silver. Excellent opportunity for investment.

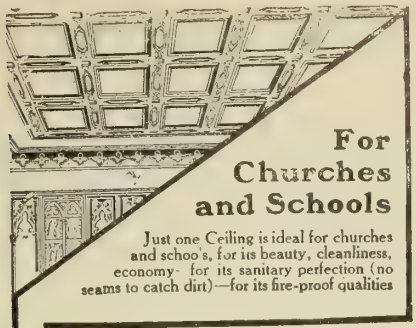
For full particulars apply to

A. Valois, Box 54,
Mattawa, Ont.

FOR SALE

A valuable property of Iron Pyrites in the Township of Madoc, about 1½ miles from the Bay of Quinte Railway. Two veins 11½ feet wide and 6 feet wide respectively of high grade pyrites, averaging 52 per cent. sulphur. Mining cheap. Veins have well defined walls. Mine is on side of high hill.

For further information apply to



S. Wellington, Box 63, Madoc,
Wm. Cross, Box 150, Madoc.

Fine White Gypsum Quarry In Newfoundland For Sale

Quality A1, Quantity Inexhaustible, Favorably Situated for Export to Canada and United States, and if Calcined at Quarry can command the British and some of the Continental Markets.

☞ **This is a Most Desirable Investment and can be had at Low Price** ☜

Apply to J. H. CATHRAE, 5346 Calumet Ave., CHICAGO.

For Churches and Schools

Just one Ceiling is ideal for churches and schools, for its beauty, cleanliness, economy- for its sanitary perfection (no seams to catch dirt)—for its fire-proof qualities

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	**$80.00 to $500.00**
2nd " - -	**45.00 and 47.50**
3rd " - - - - -	**28.75**

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre :

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions : The full price must be paid in cash ; specimens must be produced and accompanied by an affidavit ; a survey at the cost of the applicant must be made on unsurveyed lands ; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run,

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to :

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

Underwood

The Underwood Unit, Bill or Order Typewriter, is used to facilitate the handling of bills or orders.

The order is made out upon a set of unit forms, as many as may be required for different departments. The original is the invoice; the second, an office copy or price sheet; the remaining copies may consist of acknowledgments, requisitions, shipping memoranda, etc., which are distributed to the various departments after the order is entered.

The forms may be so designed that each will contain only the information required by its special department. Let us send you a book about it.

United Typewriter Co., Limited, Adelaide St. East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

1 000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

Announcement

THE Souvenir Handbook, commemorating the recent Ontario visit of the American Institute of Mining Engineers, is in press and will appear within a few days of this current number of THE CANADIAN MINING JOURNAL. In scope, in press-work and in text this volume will be of signal interest. Its publication will be an event of importance to the mining fraternity of Ontario. A wide circulation in Great Britain and the United States is already assured. In addition to its value as a descriptive and historical record, the Handbook will be the means of advertising certain of Ontario's mineral resources in a clean and honest way.

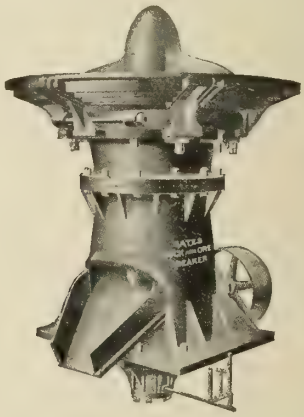
EVERYTHING IN MINING

Purchasers may avoid the delays inevitable in dealing with half-a-dozen companies for different portions of their equipment and obtain better value by purchasing their entire equipment from One Company.



The "Lidgerwood" combined friction drum and brake and reversible link motion hoisting engine is the most economical yet made for mine hoisting.

Three of our 600 h.p. Induction Motors driving blowing engines at the Canadian Copper Co., Copper Cliff. This type of motor is specially adapted for all mining operations.

This is a view of three of our Ingersoll steam drills engaged in rock excavation

Gates "K" Rock and Ore Breaker will break more per horse power than any other ever built.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

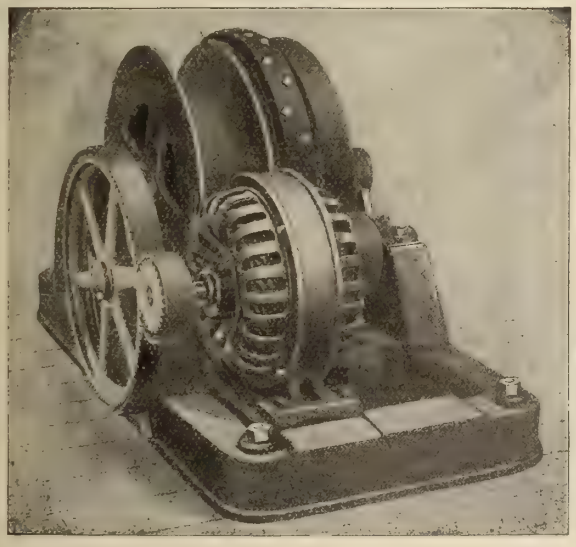
$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.



Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Westinghouse Motor--Drive

For Mines

There is no other method by which mine apparatus can be so efficiently operated. It allows machines being moved about at will and relocated with the greatest ease, and of their being controlled from any convenient point. There is practically no loss in power transmission.

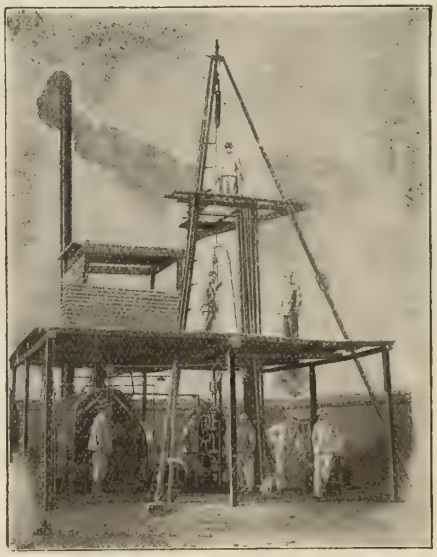
The First Step--

In the exploration and development of mineral property, should always be through DIAMOND DRILL PROSPECTING.



A diamond drill core indicates the exact position, extent and quality of the mineral sought, and the character of the strata overlaying and surrounding it.

The operator may thus estimate the cost of developing and working his property, and of preparing the product for market, before spending a cent for shafts or tunnels.

Sullivan Diamond Drills are built in over 25 sizes and styles, for prospecting work of any nature and under any conditions.

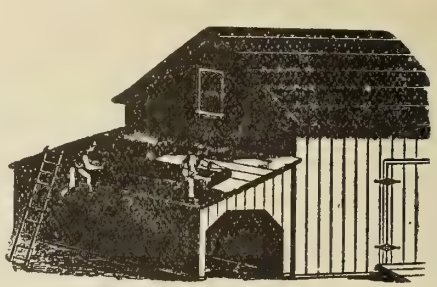
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

MACHINISTS, FOUNDERS AND BOILERMAKERS.

Leading Features of a Good Rock Drill

No. 3.—Patented Adjustable Shell

The Patented Adjustable Shell of the "RAND" Drill is a valuable feature, and is the only practical adjustable shell on the market. By removing one or more of the thin sheet-iron shims and tightening the slide bolts again both top and side wear is taken up. The shims are held by dowels, so that they cannot wear out. On the smaller drills the shells are made of malleable iron, but on the large drills where the shells are subject to greater strains they are made of the highest grade of open-hearth steel castings.

This arrangement of guides assures the maximum of bearing surface whatever the position of the drill. Adjustment is secured by taking-out liners, therefore no extra stock is needed.

McGill University

MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.

A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

OFFICIAL REPORTS.

The value of Government reports, more especially of reports having to do with mining, depends upon three qualities—timeliness, comprehensiveness and accuracy. Of these three virtues the first is not the least, and with it we have here to do. The Geological Survey of Canada, under the present Director, has issued its publications with most praisworthy promptitude. The British Columbian and Nova Scotian Governments have been not unreasonably tardy in presenting to the public their statements of mining operations for 1906. Alberta's pamphlet came late upon the scene. Quebec's has just appeared. Ontario's is yet to come.

We can see no reason why this carelessness should be allowed. If, as is probably the case, the officials who are responsible for the appearance of the annual reports are overworked, if their time is so broken up as to prevent their giving consecutive weeks of attention to these important publications, then more help is required and must not be withheld.

In each and all of the Provinces mentioned mining is an industry of major importance. The expense of engaging competent men to improve and supervise the Departmental publications would be a mere drop in the bucket of annual expenditure. Neither lack of funds nor any other plea of false economy can hold as an excuse for the negligence that permits an annual report to be more than six months late.

Of all the Provinces Ontario has more reason to need prompt official mining information and least reason to be subjected to irritating and harmful delays. The Province is rich. Her mines are contributing large sums to her treasury. If more help is needed it is easily available; if more help is not needed then there is no other valid excuse.

Last spring, acting on the information of the Ontario Bureau of Mines, a geologist visited, inspected and reported upon Larder Lake. His report is not yet published. Its prompt publication would have obviated a vast deal of robbery and dishonesty and would have done actual good. Good its belated appearance will do yet. But, meanwhile, the district, quite irrespective of its natural wealth or poverty, has been made the hatching ground of criminally fraudulent schemes—schemes carried out, we regret to say, by Toronto brokers. This plundering of the public should have and could have been stopped by the timely publication of an honest report.

There is indeed no valid reason why Departmental reports should be even six months late, and, with business-like methods, they could be published within three or four months of the close of the calendar year.

But since there necessarily is a certain amount of uncertaintiy as to the precise time at which a complete annual report can be made ready, we would recommend strongly the distribution of unbound interim reports and of bulletins. The bulletins issued by the United States Geological Survey and those distributed for a time by the Dominion Survey are of questionable value. They are primarily intended for immediate transcription by the press and may be incidentally useful. But we are of opinion that reports upon important mining districts should be completed, printed and distributed with all possible speed.

The Provincial reports of mining operations are all fairly comprehensive. The British Columbian report conveniently lists the mining companies. It is well illustrated and creditably put together. Ontario's reports usually include a treatise, written by a specialist, on some one branch of the mining industry. Generally speaking the Ontario reports contain a greater amount of geological information than can be found in any others. In geological maps also Ontario's volumes are far ahead of the rest of Canada.

Quebec and Nova Scotia, especially the former, issue reports that are, both in appearance and in contents, absurdly slim and inadequate. For this the Governments and not the heads of the respective Departments, must take the responsibility. We have no doubt that the Departments of Mines in both Provinces spend all available money on their reports. But when the annual records of a mining Province like Nova Scotia can be disposed of in a cheap paper bound pamphlet of a few score pages, accompanied by neither maps nor illustrations, there is something radically wrong. To a less degree this may also be said of Quebec. Quebec, more than any of her sister Provinces, needs a presentable, carefully edited annual mining report. Therefore she must assuredly make larger appropriations for this purpose.

In one sense it is true that the excellence of the official Departmental report on mining is a function of the progress of a country's mining industry. The importance, the absolute necessity of giving to the world year by year and, we would add, in some cases month by month, authentic official records of investigations, discoveries, exploration and progress cannot be gainsaid. Money spent in such work is bread cast upon the waters. But the bread must be cast at high tide.

IRON SMELTERS FOR TORONTO

An offer has been submitted to the City of Toronto by the Moose Mountain Mining Company. The company promises to erect large smelters on a part of Ashbridge marsh if the city will grant them the ownership of 350 acres. This is the only condition. No bonus is asked. The company, whose spokesman is Mr. D. D. Mann, of Mackenzie & Mann, has entire confidence in its ability to carry out its plan. The land asked for is worthless in its present condition—as its name implies. To redeem it, to lay foundations for large furnaces with a proposed aggregate capacity of 700 or 800 tons of pig iron per day, would occupy at least a year. Another eighteen or twenty-four months would elapse before the furnaces, stores, coke ovens, ore handling machinery could be put into working order. The prospect entails an expenditure of several million dollars for a plant to produce only pig iron. If steel is to be made larger sums will be necessary. Directly and indirectly the carrying out of this bold but perfectly practicable enterprise will mean the creation of a new industrial town within the city limits of Toronto and the employment of several thousand workmen.

The proposal has been enthusiastically received by the Toronto newspapers. Indeed it has met and will meet the approval of all thoughtful citizens.

Toronto will receive in exchange for a number of acres of marsh land an industry for which she would be justified in paying millions of dollars.

THE CANADIAN MINING INSTITUTE.

The Secretary of the Canadian Mining Institute returned recently to Montreal from an official visit to British Columbia. As will have been seen by the list published in our last issue, many new members were added to the membership of the Institute. Such visits are to be encouraged. We should see the Secretary more frequently in Ontario. Nova Scotia should also be regularly on the visiting list. An official viist, giving as it does an opportunity for personal explanations of the Institute's aims and objects, is more valuable than any number of typewritten communications. However, the Secretary deserves praise and commendation for the good results of his tour of the West. We hope that the time will soon come when the most important official of the Institute will be free to visit all parts of Canada once every six months. On this point we are to publish presently several communications.

BORROWED PLUMAGE

A subscriber has sent us a document that makes most painful reading. It is an appeal to Queen's University men to subscribe for the stock of the Combined Gold Fields, Limited. The letter is signed by Alfred Fitzpatrick, B.A., a graduate of Queen's. The stationery, as may be seen by referring to the half-tone reproduction on this page, is that of the Reading Camp Association. The names of prominent citizens appear thereon. Naturally these names have nothing to do with the Combined Gold Fields, Limited. Naturally, also, the average reader of the letter will be influenced by the fact that such names do appear.

Mr. John Sharp, late a lecturer in moral philosophy at Queen's University, is referred to as a director of the company and as general manager. Shares of a par value of $1 each are urged upon Queen's men at the price of

10 cents. The capitalization of the company is $3,000,000. It holds twenty-one mining claims in the Larder Lake mining district.

Some months ago, before the time had come for THE CANADIAN MINING JOURNAL to take a decided stand in these matters, there appeared in some of the Toronto newspapers a large advertisement over "Professor" John Sharp's name. The advertisement was as unbusiness-like and as remote from true mining as anything that

We do not know how the Reading Camp Association is organized. The names of its officers, however, show that it is a respectable missionary or educational enterprise. Mr. Fitzpatrick as Superintendent of Camp Education may be, no doubt is, a useful citizen.

But when Mr. Fitzpatrick prostitutes this enterprise, takes liberties with the official stationery and shamefully misuses the name of Queen's for his own pecuniary benefit, we have no hesitation in condemning

TELEPHONE 119

P.O. DRAWER 31

New Liskeard, Ontario Oct. 9, 1907.

Dear Friend,

On the opening of the Larder Lake Mining District Prof. John Sharp and I sent in prospectors who located a number of good properties.

We have organized the Combined Gold Fields Limited, with a capitalization of $3,000,000

This Company has 21 of our claims, each claim having about 40 acres. A discovery of mineral has been made on every claim. We have had the properties thoroughly examined by an independent expert mining engineer (Cambridge, Eng.), and his report is very encouraging

One large vein of quartz, from 20 feet to 30 feet in width. extending through the claims (80 acres), gives assays of from $3.90 to $10.60 per ton, the richness increasing with the depth. This claim alone promises to be rich enough to warrant an investment. We have good reason to expect that the venture will prove very profitable to all concerned.

You are no doubt aware that the richest mines of the world are low-grade propositions, in some cases their ores assaying not more than three to four dollars per ton.

It would give us much pleasure to have a large number of Queen's men associated with us as shareholders. Three of our seven directors are graduates of Queen's — Prof. John Sharp, Mr. James Hales and myself — and several other Queen's men are shareholders. Prof. Sharp is General Manager. His work so far has received very high commendation.

More money is urgently needed to sink shafts, procure stamp mills. etc., and we should like very much to have you become a shareholder and help carry on the work. You may rest assured that the directors will use every possible effort to make your investment profitable to you.

If you care to join us in this enterprise, you may have shares at 10 cents each. These shares are of the par value of $1.00 each.

Please send your application to Mr. James Hales, Traders' Bank Building, Toronto. You incur no personal liability beyond the amount of your subscription.

Yours sincerely,

A Fitzpatrick

Law & Company ever produced. But there was in it an element of almost pathetic simple-mindedness. We thought on reading it that here was a man, as ignorant of the ways of the world as he is of mining. We forebore from unkind speech.

However, the appearance of this circular has put "Professor" John Sharp, together with his associate, Mr. A. Fitzpatrick, in an unenviable position. The latter is obviously the chief sinner.

him without reservation or equivocation. Mr. Fitzpatrick as a graduate of Queen's is attempting to transmute into dollars and cents the University spirit. As superintendent of a praiseworthy educational scheme, he trades upon the standing of his employers in using their official stationery. And as an educated Canadian he should be heartily ashamed of himself.

It is a far cry from moral philosophy to gold mining in Larder Lake. "Professor" John Sharp appears to

have made the change with ease. But the transition seems to have robbed him of certain ethical concepts. Can Mr. Sharp think it a decent, an honest thing, for him to allow his name to be used in such a connection as this?

The circular contains not one important item of information regarding the claims. The "independent export mining engineer (Cambridge, Eng.)," and his "very encouraging report" is not information. It is simply the orthodox formula used by all wild-cats. The capitalization of $3,000,000 may be all intended for promotion stock. Nothing on this point is specified in the letter.

How deep has "Professor" Sharp sunk on his 20 foot vein that he is warranted in stating that the ore grows richer to the deep? What tests have been made and where?

The letter is singularly silent on all these essentials. On "Queen's" and on 10 cent stock it is strong.

If Mr. Sharp has a promising mine he does not need $3,000,000 to work it. If he had knowledge of the profession of mining and *faith in the mine* he would not ask for $3,000,000. He would be glad to get the few thousands necessary to erect a stamp mill and then depend upon his gold bricks for the rest. But, sad as it may seem, the methods of Mr. A. Fitzpatrick and "Professor" John Sharp are alarmingly like those of Law & Company. This in itself is full condemnation.

We need only add that we shall see to it that both Mr. Fitzpatrick and "Professor" John Sharp are not allowed to benefit by their astonishing indiscretion. Both of these gentlemen and all of their associates may count upon the disapproval of those who honor Queen's for what she is. Within her walls are no money-changers.

AN INSIDIOUS ASTERISK.

Among the exchanges coming to this office are many Canadian newspapers. In several of them we have noticed the glaring advertisement of Law & Company. Lately Law & Company have become more discreet. But in looking over a Nova Scotian newspaper, dated October 19th, our eye fell upon a paragraph, purporting to be a regular press despatch and not distinguishable from ordinary telegraphic news, save by one mark—a small asterisk at the end. Looking up the column we noticed the advertisement of a corn cure with the same mark, and throughout the paper the advertising paragraphs were similarly marked.

The paragraph in question is dated from New Liskeard. It narrates vividly the enthusiasm of a Mr. F. W. Rosser after he had inspected the Highland Mary claims. It speaks of a slab of gold quartz "valued at over $15,000 in gold to the ton."

When the promoters of a mine descend (although it were a difficult feat for Law & Company to descend at all) to patent medicine methods of advertising, fake is writ large on their enterprise.

Let us again remind the public that the owners of rich mines do not advertise. The appearance of such announcements as Law & Company's are most cogent proofs of their own lack of confidence in their alleged mines.

PEACE.

The strike of the employees of the Cumberland Coal & Railway Company at Springhill has ended. A conference between the miners and Government officials, held in Halifax at the suggestion of Premier Murray, appears to have had the happy effect of clearing up much misunderstanding. The miners decided to accept the Board of Arbitration's finding. Work is to be resumed.

While we are heartily glad that the strike is ended, we must express the opinion that unless peace is to be lasting and unless the public can be assured that hereafter the awards of the Board of Arbitration will be accepted without question, no material gain will have been made.

There is something radically wrong when workmen go out on strike so frequently as has been the case at Springhill. It is not possible that the men are altogether to blame. Nor is it expedient to attempt to analyze the history of successive troubles and apportion out the responsibility for the friction. Let the past take care of itself. For the future it must be demanded that both employers and employees avoid the very appearance of evil. Springhill has not a proud record. It will take many years of harmony and good-will to compensate for her long period of costly strife.

RESEARCH

The newly appointed Professor of Chemistry at McMaster University, Dr. J. Bishop Tingle, in an inaugural address hinted that the best investment for Cobalt mine owners would be the establishment of a laboratory of research for students of metallurgy and chemistry. This is a vitally practical point, and Professor Tingle did well in impressing it upon his hearers. Not in Cobalt alone, but over the whole length and breadth of all the mining Provinces of Canada, there are problems awaiting the trained young Canadian scientist. Some of our coal mines present a series of intricate questions in the preparation of their product for the market—the elimination of slate, sulphur and other impurities by washing, the utilization of slack and culm are examples of there. The concentration of our vast bodies of low grade iron ores is another wonderful field for investigation.

Apart from the ores of the precious metals, in the reduction and treatment of which peculiar difficulties are met in every mining camp, there is room for a great deal of pioneer work in connection with the ores of the base metals and the non-metallic minerals.

A technical college that systematically encourages the pursuit of practical and useful subjects is not merely utilitarian. It is living up to the highest ideal of life, inasmuch as it is attempting to fulfil its true purpose.

THE HENDERSON TALC MINE.

In the report of the Bureau of Mines for 1899 mention is made of the discovery of a deposit of excellent talc in the vicinity of Madoc, and the opening of a mine, the product of which was shipped to New York. The hope is then expressed "that Canadian capital will be found to operate the mine and prepare the product for market at home. This latter is yet an unfulfilled desire. In the summary of mineral production of Ontario for 1899 the talc mined is set at 100 short tons, valued at $500.

In the succeeding year the mine is reported as having attained a depth of 53 feet. The width of the deposit of merchantable talc is put at 34 feet. The quantity raised at the two above mentioned mines during 1903 is fixed at 920 tons, worth $2,625.

One thousand three hundred and thirteen tons, valued at $2,919, was the quantity produced by Ontario in 1904. Apparently all of it came from the Henderson Mine. The year 1905 saw about the same quantiy mined, and in 1906 1,234 tons, worth $3,030. The output for 1907

TALC STOCK PILE.—HENDERSON MINE.

The report of the Bureau for 1900 mentions the discovery again, and dwells upon its importance and upon the purity of the talc. The shaft was then 43 feet deep, with a cross section of 18 by 20 feet. The output for 1900 was 1,000 short tons, valued at $5,000.

In 1901 the Henderson Mine (that name still clings to it) was idle; but talc was shipped from the dump to the quantity of 400 tons.

During 1902 the Henderson Mine and another talc mine near Gananoque produced together 697 tons, valued at $930.

will total about 1,500 tons. The values per ton heretofore assigned are much below the actual price obtained for the talc.

The Henderson talc mine was discovered eight years ago by James E. Harrison, of Madoc. It is a quarter of a mile from the north shore of Moira Lake, and a mile and a half southeast from the Town of Madoc. Moira Lake, as beautiful a sheet of water as one could wish, stretches nine miles east and west, with an almost uniform width of a mile.

View of Shaft Mouth.

View of Shaft Mouth.

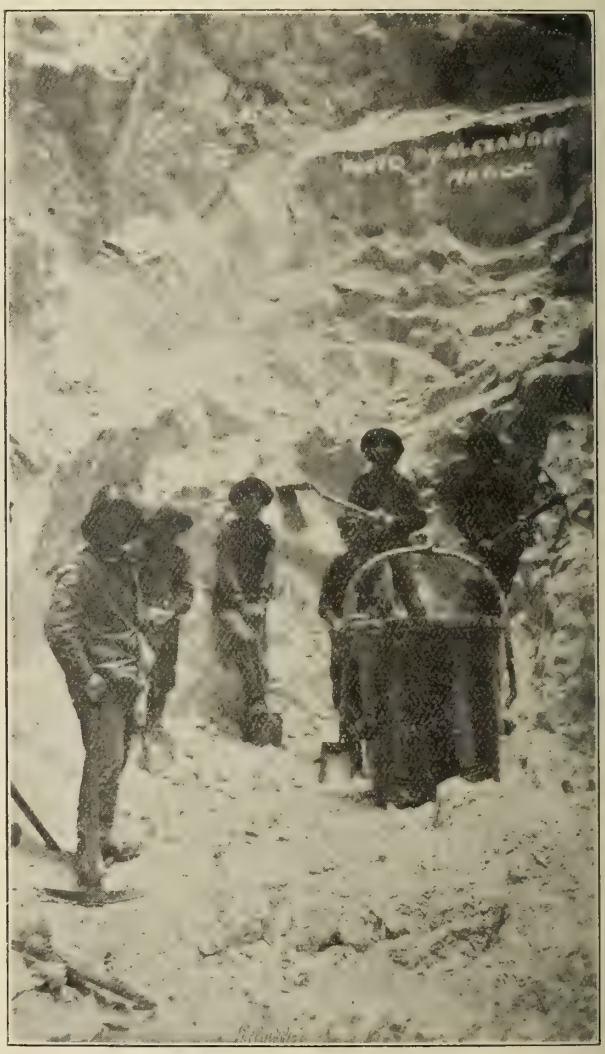
The mine on lot 14, concession XIV. of Huntingdon Township, Hastings County. It is operated under lease by Messrs. S. Wellington and William Cross, of Madoc. Mining is conducted for only three or four months of the year and the talc is consigned in lots of five or ten car loads to New York. The demand is limited to a maximum of 1,500 tons per annum. The present capacity of the mine is easily 60 tons per day. But since work is not continuous, time and money are wasted in unwatering and cleaning the shaft each season.

The working equipment consists of a stationary boiler and a steam hoist, by which two half ton buckets are operated. Drilling is done by hand, a 1 1-2 inch ratchet auger being used. The shaft is entirely in clean talc and blasting and breaking are easy.

The shaft is 105 feet deep. It bottoms in clean granular massive talc. Neither hanging nor foot wall is visible to the deep, where the shaft is 25 feet wide by 30 feet on the strike.

It was the intention of a previous operator to start drifting at a depth of 60 feet, and stations were started. But trouble ensued and the present lessees found it necessary to widen and clean out the shaft and carry it to its present depth before drifting could be begun safely.

The shaft or pit, as it is more properly, now opens about 40 feet by 35 feet at the mouth and narrows down



Stock Pile, Derrick and Power House.

irregularly to the bottom measurements mentioned before. Drifting is to be commenced next summer and the deposit will be proved to a very considerable extent. The maximum width of the vein is about 36 feet. This measurement is obtainable near the surface, where, in the pit, the walls are visible. The strike is north 40 degrees west. The talc vein cuts across a tilted deposit of dolomitic limestone. The dip is 80 degrees south.

Three hundred feet to the northwest a large outcrop of the vein is visible. Hence the probabilities are in favor of the deposit being large enough to meet an increased demand for some years to come. It is the intention of the operators to win their supply of talc in future by drifting to the strike. This will of course develop the property to the best advantage.

The stock pile, containing between 400 and 500 tons of this gleaming white mineral, was a remarkable sight at the time of the writer's visit. The massive talc shows not a tinge of extraneous coloring matter. No impurities are visible. There are occasional inclusions of leek-green serpentine, which, however, powders pure white and is not culled from the shipments.

The United States production of talc and soapstone during 1906 amounts to 120,644 short tons, valued at $1,431,556. The average value per ton derived from these statistics is not reliable. The many grades of material mined and the conditions of production influenced the price in different localities. But throughout the United States there was during 1906 a marked falling off in the supply of the purer grade of talc, such as is mined at Madoc. Fibrous talc, included in the returns specified above, was mined to the extent of 64,200 short tons, valued at $541,600 or $8.43 per ton. The uses of fibrous talc are much less numerous than those of the white granular massive variety. Moreover, fibrous talc, of which the State of New York is the principal producer, is intrinsically less valuable. The Canadian product is sold at a high price in New York. The exact figure we are not at liberty to quote. But the market is limited and close. Hence production must be cur-

Bottom of Shaft—Henderson Talc Mine.

tailed to a specified amount. There is no doubt that in an open market the Madoc talc would bring a much higher figure.

The process of preparing the crude talc for manufacture is cheap and simple. A little scent, an ingenious tin box and a reproduction of the features of an enterprising druggist convert the dried and milled talc into a relatively costly toilet powder, on the sale of which enormous profits are realized.

There is room here in Canada for the manufacture of many articles now imported from other countries, principally from the United States. A mill for grinding and preparing the talc would cost but a few thousand dol-

lars and might readily be the basis of many flourishing industries.

To illustrate this a few of the uses of prepared talc may be cited. Powdered or flour talc is used in the manufacture of electric insulators, steam pipe insulators, foundry facings, fireproof paints, "dope" for dynamite, paper, toilet powder, lubricators, etc., etc. It also plays an important part in the manufacture of leather goods and of soap. Other uses to which powdered talc is put we shall not describe beyond mentioning that the mineral is made to play the part of an adulterant in certain foodstuffs. But sinful man and not the useful mineral must be blamed for this.

Hearthstones, furnace linings, laboratory tables, laundry tubs, gas tips, pencils and an almost infinite number of lesser articles are manufactured from the massive unground steatite.

The operators of the Henderson Mine, Messrs. Wellington & Cross, are members of the Madoc Mining Association. The president is Mr. W. A. Hungerford and the secretary is Mr. R. T. Gray. Mr. A. W. Coe is first vice-president and Mr. Wellington second vice-president. The Association meets fortnightly in the Board of Trade rooms. Here opinions are exchanged and mining matters are discussed. The organization, which is closely affiliated to the Board of Trade, is informed with the spirit of mutual helpfulness. The members realize that their district needs not booming, but steady, careful attention. There are no capitalists in this handful of mining men. But there are self-reliant, strong men of high courage, who intend to win and who have a large faith in the mining possibilities of Hastings County.

Madoc is a bright, well-paved thriving country town. A visitor's first impression (and his last) is one of substantial prosperity and intelligent progressiveness.

BOTTOM OF SHAFT—105 FEET—HENDERSON TALC MINE.

DIFFERENCE OF THREE CIPHERS.

ALEXANDER GRAY.

That the Witwatersrand gold fields are the ultima thule of concentrated riches was long since conceded by unprejudiced mining authorities. But when Mr. J. B. Robinson, the wealthiest of the coterie of magnates, identified alike with the Kimberley diamond mines and these Witwatersrand "banket" beds, proclaimed in London recently, that gold worth $5,000,000,000,000 remained these, he blew out the boiler plates, wrecked all previous conceptions of what part the forty miles of so-called Main Reef Series are to play in this century's monetary affairs, and "pied" the calculating machines of distinguished international experts. Next day Mr. Robinson hastened to revise his "copy," ran the blue pencil through three superfluous ciphers, and the concrete fact remains that this millionaire mine owner expects a gold-getting record of $5,000,000,000 before the mills of the Rand are dismantled and the last retorted metal poured. Thus the strain upon the credibility of scientists was relieved. A slip of three ciphers bridged the chasm between the possible and the grossly hypothetical. Another five billions in ingots will suffice to firmly establish the Witwatersrand in the same class as the Standard Oil and United States Steel trusts; and it is not at all surprising that Mr. Robinson became so entangled in ciphers he inadvertently took the limit off popular credulity. Had the Robinson figures been reaffirmed they would have overwhelmed those of Hamilton Smith, Hammond, Jennings, Legget, Hatch, and others less roseate, though all sufficient. Five billions in sight make the life of the Witwatersrand 33 years in-

stead of 3,333, as Mr. Robinson first noted, accepting the current rate of production as the average, and in any event a third of a century may reveal other sources of gold supply.

Mr. Robinson, having returned from South Africa, no doubt seeks to dispel the gloom encircling that "most distressful country," a gloom which holders of "Kaffir" scrip find ruinously expensive. His arrival during a period approaching panic was inopportune, but there is consolation in the gentleman's change of front, because it is not so long ago that he advised the voluntary liquidation of his Robinson South African Banking Company owing to the inadequacy of general business in South Africa. There were too many banks. Now there is business in abundance and no blanks. Every package contains a prize. Such are the uses of adversity. Reaction and reagents have evolved phenomenal optimism out of a decade of despair. So it is in order to realize on expectations and induce financiers to forget all the writings off revealed in balance sheets with distressing regularity.

Besides the five billions, "there are immense deposits of gold, gems and minerals as yet untapped in the Transvaal," said Mr. Robinson. Before proceeding to determine the factor of the payability of these, from the Limpopo to the Vaal Rivers and Bechuanaland to the Portuguese border, investors expect the Botha Ministry and the magnates to give them something more substantial than glowing prospectuses. Underwriting syndicates have had too many cold douches to venture further afield, and while the Witwatersrand has prestige to which it is properly entitled, there will be no rush of fresh funds until greater concert prevails between the Botha Ministry and the masters of the mining industry. Conceding the point that there is no longer danger of South Africa's "exhaustion," as has been argued by the advocates of restricted energy, Mr. Robinson emerges from his voluntary retirement and unfolds a treasure-laden vista extending to mid-century. In the interim there will be racial amalgamations and political readjustments. Should there be profitable by-products in the "immense deposits yet untapped," new groups will continue the labors begun by Rhodes, Beit, Wernher and Robinson, without intermission, perhaps with less friction.

A steady supply of yellow metal is what money markets and the arts will heartily welcome. Unfortunately Mr. Robinson's optimistic horoscope is overshadowed by economic influences decidedly adverse to expansion. Mr. Robinson cannot obscure these. He has publicly proclaimed them. His Landfontein and Langlaagte estates have potentialities awaiting demonstration. Large areas controlled by him lie fallow. Unskilled labor and high wages due to living charges are disconcerting and deterring elements. There may be $5,000,000,000 worth of gold, but most of it is in solution—the solution of the labor and living problems. The Main Reef Leader and South Reef are the profit earners. The likelihood of mining and milling large quantities of the Main Reef itself hardly is inducement to investors, until there are revolutionary reductions throughout South Africa's economic system. According to the cables, Mr. Robinson is left to infer that the 4 and 5 dwt. rock of the Main Reef will show a profit. It might, if the proposition was a free milling one, and mining, crushing and extraction were as cheap as they are in some other countries. Neither of these essentials is in effect at the Rand. The feeding of mills from great depths is a serious item in the costs sheet. Mr. Robinson is aware of this. Low grade ore, heavy capital outlays, dear labor, never yet facilitated the payment of dividends—and they never will. Mr. Rudd, who was associated with Mr. Rhodes in the De Beers amalgamation, and in the original exploitation of the Witwatersrand gold fields, put the case plainly when he gave the cost of bringing a deep level mine to the producing stage at a round million sterling. That there is a larger tonnage of low grade ore in the Main Reef itself than has been raised from the Main Reef Leader and the South Reef, is known, but with working costs at a sovereign, on the average, disappointed shareholders will hardly risk a favorable selling opportunity rather than await the attainment of the datum line of 15s.—working costs as decreed by Mr. Ross Browne, acting in behalf of Messrs. Wernher, Beit & Company. In that he would revive interest in the Witwatersrand Mr. Robinson has chosen the better part. To accomplish that object is going to take more time than talk.

COMPOSITION OF GLASS SANDS AND MOULDING SANDS.

A high degree of purity is required for glass sand. Its preparation, when it is not sufficiently pure, is a matter of comparatively great expense. All argillaceous material must be washed out. Massachusetts sands of exceptional purity bring $4.50 per ton after special preparation. Prices of sands in other localities range from 60 cents to $1.50 per ton.

Moulding sand, used in making moulds and cores for casting iron, steel, brass and other metals, varies from clayey loam to a clean, sharp, coarse sand, according to requirements. There are a great variety of sands used. Often loam, clay, oil, flour or molasses are mixed in definite proportions. The essential qualities are refractoriness, porosity and bond. The size of grain affects directly the porosity of the material. The finer and more intricate the design the finer the sand required. Too much clay and iron oxide will cause the mould to shrink and crack under the intense heat; too little will cause it to dry and crumble or collapse entirely. A good sand should show to the unaided eye grains nearly uniform in size, angular rather than round, and when spread on paper it should show no dust. To the touch the sand should feel sharp, and when moistened with water it must be capable of being formed into coherent balls. The following tables displays the composition of American glass sands and moulding sands:—

	Silica.	Alumina.	Iron oxide.	Lime.	Magnesia.
2	99.659	0.310	0.11	0.020	
2	98.87	0.21	0.08	0.24	0.12
3	97.50	1.50	0.50	....	0.50
4	81.50	9.88	3.14	1.04	0.65
5	84.86	7.03	2.18	0.62	0.98
6	82.92	8.21	2.90	0.62	....

President Plummer of the Dominion Iron & Steel Company is in England. He will return to Canada during the early part of December.

THE BRITISH WORKMEN'S COMPENSATION ACT, 1906.

THE LIABILITY OF MINING COMPANIES.

(Contributed)

The British Workmen's Compensation Act of 1906, which came into operation on the 1st of July, 1907, is a much more radical piece of legislation than the Act of 1897 or the Act of 1900, which were themselves perhaps as radical measures as were ever passed by a Conservative Government in the British House of Commons. The Act of 1906 extends the benefits of the Act of 1897 to almost all classes of the working population, including all domestic servants, clerks, corporation employees, and the servants of the Crown, outside the naval and military forces.

These notes will, however, be confined to considering the influence of the new legislation on the liability of mining companies, upon whom, it can be very properly asserted, the Compensation Act imposes a more onerous burden than upon any other class of employes.

In the Act of 1897 the compensation to be paid in case of disability is half the average weekly wage of the injured person throughout the whole period of disability, less the first two weeks, and in cases of death by accident a sum of not less than £150 and not more than £300, this sum being based on the average earnings of the deceased during the three years immediately preceding his accidental death.

To colliery operators probably the most important alteration to the Act of 1897 is the provisions of Chap. I., clause 2 (a), which reads: "The employer shall not be liable under this Act in respect of any injury which does not disable the workman for a period of at least *one week* from earning full wages at the work at which he was employed." In the Act of 1897 the corresponding period was two weeks.

It is the experience of all mine employers that by far the greater percentage of accidents are minor accidents, involving from a few days' to a few weeks' disability. The immune period of two weeks under the Act relieved the mine owner of liability for most of these small accidents without any hardship to the miner. The shortening of the immune period to one week puts a premium on idleness and malingering, and will impose an almost intolerable burden on the mine owner. Friendly societies and sick benefit societies flourish immensely amongst the miners of the British Isles, and it is not by any means an unusual thing for a miner to be in two friendly societies, in addition to the colliery relief fund. Suppose he is so injured as to be laid off for a month. He will receive at least $4 per week from each society, $2 from the relief fund, and half his average wage from the colliery office under the Compensation Act, say $5. This will give him a weekly income of about $15, considerably more than he would earn by working. Under these circumstances it is easily understood how difficult it is to effect a cure. The Act provides that prompt notice shall be given of any accident received, however slight, but it does not provide any penalty for non-compliance with this provision, nor does failure to report an accident invalidate a claim for compensation. It is very difficult in some cases to say whether the injury complained of was received when at work or not, particularly in the case of internal strains and sprains, or say a poisoned thumb, which may easily have arisen from causes entirely outside of a man's employment. Where a man has alleged injuries, and is drawing his "compensation," there is nothing to prevent his taking a holiday at the seaside at his master's expense, and this is indeed very often done. If in such a case the weather at the seaside is fine, and the $15 per week mentioned before is forthcoming, it may take quite a number of doctors to work a cure.

The temptation to malingering which is occasioned by the provisions of the Compensation Act is bearing very hardly on the old established colliery relief funds, and on the friendly societies, the calls upon which have considerably increased since the passing of the Act, for a very obvious reason. The colliery relief funds were supported by voluntary subscriptions from the men collected through the pay rolls, augmented by grants from the colliery companies and landlords. Most of these relief funds have had the handling of large public subscriptions collected after the great explosions that have marked the history of British coal mining. They have done a notable work in the past, but now that the chief reason for their existence is removed by the provisions of the Compensation Act, they will in all probability decline and gradually be wound up. It is very obvious that the subscriptions of the colliery owners will cease.

The cost of compensating those permanently injured is now much larger than it was when the Act was first passed, because the number of persons permanently injured is cumulative, and the full burden of this class of compensation has not yet been felt.

Much hard feeling has been caused by the dismissal of aged workmen about the mines, but it cannot be said that the mine owners had any choice in this matter. When a man passes a certain age even a slight injury may prove a permanent disability when added to the decay of advanced years. We have known colliers hale and hearty at 65 and 70 who began work below ground at the tender age of seven years, but no employer could afford to retain workmen of this age, and run the risk of their becoming permanent pensioners on his pay roll. Formerly these men were employed as watchmen, axle greasers, etc., and in light work suited to their powers, but now one can find very few men around the English mines who are over sixty.

The most difficult cases to regulate in the permanent disablement class are those alleged to arise from internal strains. When such cases have been compounded for a lump sum there have been some rather miraculous cures. In a case recently reported in the *Colliery Guardian* it is stated that a man died in hospital from the result of an alleged strain received at work, but the post-mortem proved that he had really died from Addison's disease. Such cases are peculiarly difficult when the man is over 50 years.

A difficult feature is that in many or in most cases the examining and certifying doctor is the colliery medical officer, who is indirectly the servant of the workmen. He naturally does not wish to displease them, and is often placed in a difficult position. Generally, where a doubt exists the workman will get the benefit of it. The new law provides for the appointment of medical referees to be chosen by the State, who shall not be in private practice. How this will work out it is as yet too early to form an opinion. Political wire-pulling will without doubt have a good deal to do with the appointment of these officers. A prominent miner's leader the other day

referred to these gentlemen as "detective doctors," and appeared to very much resent their appointment.

The death claims payable under the Act are perhaps the least onerous. Chap. I., clause c, runs as follows:—"If it is proved that the injury to a workman is attributable to the serious and wilful misconduct of that workman, any compensation claimed in respect of the injury shall, *unless the injury results in death or serious disablement,* be disallowed." The words italicized are new in the Act of 1906, and it would appear that all deaths by accident at work come under the provisions of the Act as to compensation, even when due to serious and wilful misconduct. In a case recently tried before an English Court it was shown that a workman who had been killed by a blast in the mine had apparently committed deliberate suicide. His fellow-worker testified that his manner had been depressed, and that while he could not suggest that the man had committed suicide, he did not think the death was accidental. The judge held that such a death would be repellent even to a man who contemplated suicide, and awarded compensation to the extent of £120 to the deceased's widow, who had not for some time been living with her husband.

Since the passing of the 1897 Act there has fortunately not been any colliery explosion in the British Isles attended with any great loss of life. The safety lamp and the application of scientific research to mining have rendered the modern mine a comparatively safe place, apart from the constant accidents from falls of roof and side. We hope the days of such catastrophes as the Old Oaks, Lundhill, Swaithe Main and other memorable explosions in England are gone forever, but the Courrières disaster was a hideous reminder that such things may again occur. Under the Compensation Act the mine operator is liable for such large payments in a case of this sort that it would in all probability mean bankruptcy for even the wealthiest companies when added to loss of output and damage to property. Under the provisions of the Act of 1906 the claims of dependents of injured or deceased workmen are preferential under the Bankruptcy Act, and have a first claim on the assets of the company involved.

It will thus be seen that the Workmen's Compensation Act of 1906 is likely to become an "Old Man of the Sea" on the shoulders of the coal mining industry in Great Britain. It is moreover, a distinctly unfair burden, for it bears on the colliery operator alone, whose position of late has not been a happy one. The owner of the coal bears no part of the expenditure. His royalty cheques must be paid, come what may, but the colliery operator has to face a yearly increase of municipal and county taxation, higher wages, higher freight charges, increased cost of material, the Compensation Act, and over all increased foreign competition, unhampered by socialistic legislation.

It is not at all unlikely that legislation of a similar character may become a live question in Canadian politics very shortly. Drafts of bills based on the British

BRITISH JOURNALISTS AT COBALT TOWNSITE MINE.

Workmen's Compensation Act of 1906 have been presented in several of the Provincial Legislatures. Such being the case, it may be timely to endeavor to forecast the probable cost of such a measure to Canadian coal operators. There are no accurate figures available by which a calculation could be made from Canadian data, as no record has ever been attempted of other than very serious and fatal accidents. We must therefore use English data very largely in attempting to forecast what this probable cost would be were such legislation to go into effect in the Dominion.

Mr. Markham, the miners' representative for South Wales, stated in the British House of Commons when the "fortnight clause" was under discussion that the cost of the 1897 Act in South Wales had been 1½d. or 3 cents per ton, and from other calculations we have made this figure is about correct. Taking the annual coal production of Canada at 10,000,000 tons, a mark that will very soon be attained, will give a cost to the operators of $300,000 annually, more than half of which would be borne by the coal operators of the Province of Nova Scotia alone. In this Province the cost of the relief societies at the collieries averages from .8 cents to 1 cent per ton, and the relief paid is from $3 to $3.50 per week, which is about half of what would have to be paid under a Workmen's Compensation Act. Doubling this cost per ton, therefore, on 10,000,000 tons, we get a figure of $200,000, but one must consider that the death claims paid under the British Act are from $750 to $1,500, as compared with from $60 to $100 by the relief socities. If the tons raised per man killed are taken at 200,000 tons, we have 10,000,000 divided by 200,000 equals 50. As very few miners in Canada earn less than $500 per annum, we take the figure of $1,500 death compensation which gives $75,000, making a total in this second calculation of $275,000. But it is difficult to figure what the payments under a Workmen's Compensation Act would be from relief societies data, for under the constitution of these same societies malingering is reduced to a minimum, because the members watch one another, whereas under a Compensation Act, the incentive to do this is removed. The *Colliery Guardian* for 11th May, 1906, quoted in an editorial on the subject of malingering from a circular issued by the South Wales Coal Owners the following significant figures:—

Employees injury and compensated per 1,000—

1899	26 per 1,000
1900	39 per 1,000
1904	54 per 1,000
1906	60 per 1,000 (estimated)

The circular states the belief of the coal owners that this figure will increase to 200 per 1,000, which by the way is the actual percentage borne by the members who have been injured and relieved to the total membership of the West Riding Permanent Miners' Relief Fund (Yorkshire), a society having in the neighborhood of 30,000 members.

With reference to long disablement cases the South Wales Coal Owners' circular states that the percentage of men disabled for periods over twelve months was in 1903, 6.72 per 10,000, in 1904 14.87, and in 1905 17.66 per 10,000, and this notwithstanding a steady decline in the actual number of serious accidents, such as fractures, which in 1904 was only 221 compared with 258 in 1900. Internal injuries and strains, correct diagnosis of which is difficult, are responsible for the most persistent cases.

An Act such as the one under consideration bears more hardly on the coal owner than on anyone else. The work of a miner is accomplished under certain acknowledged risks, which he accepts, and in consideration of which he is paid a higher wage than perhaps any other laboring man. He is more subject to minor accidents than any other workman, accidents of from one to three weeks' duration of disability. The principal of compensation according to wages earned works therefore to his great advantage, and to the mine operator's equal detriment. Eventually a compensation bill must react upon the miner, for coal operators cannot continue to pay high wages and compensation for accidents pro rata without raising the price of coal or forcing a reduction in wages.

The present system of accident relief among the majority of Canadian mines is provided by joint contributions of the men, the employers, and the Government; a scheme very similar to that which obtains in Germany, and which has been found to work very well both there and here. The chief evil of such an Act as the Compensation Act of 1906 is its marked tendency to foster malingering, which it does chiefly by reason of an absolute divorcement of responsibility from the workmen, and the laying of the entire onus on the shoulders of the employers. It would seem that the most equitable arrangement for Canadian conditions would be an amplification of the present colliery relief funds. Any legislation along the lines of the Compensation Act of 1906 is quite uncalled for, and would seriously hamper the growth and development of coal mining in Canada, and would confer a very doubtful benefit on the miner. In England its effect has been to sap the moral integrity and the manly independence that used to characterize the "collier laddie." In saying this, we refer to minor accidents and some permanent cases. The death compensation payment is not open to this objection. In some cases the sums paid over to widows have been shamefully squandered, but some provision for widows and dependants of men killed at work should in all justice be provided. But it should not all be expected from the coffers of the coal operator, whether death occurred through "serious and wilful misconduct" or not, as it now is. Even a "coal baron" has his rights.

It is often urged that the provisions of the Compensation Act are such as to ensure greater safety to the workmen, because of the extra care taken by the employer to guard against his liability. In the case of factories or where there is much machinery this may be more or less true, but it is not so true of the actual work of mining, where more than perhaps in any other avocation the ceaseless vigilance of the miner himself is the best guarantee of his safety, and it is not equity to saddle the mine operator with the consequences of his employee's negect. Everybody who knows the inside of a mine knows also that careless and reckless men are to be found among miners, or else why have we laws by which men are bound to take reasonable precautions for their own safety and why do prosecutions occur for breaches of these laws? That a man can be punished by law for misconduct of this kind, and yet if it happens that he is seriously disabled or killed by reason of such misconduct his employer must pay therefor, are anomalies the non-legal mind cannot quite comprehend or reconcile.

Goldfield's Production.

The total production of Goldfield from the inception of the camp up to June 1st, 1907, amounted to $12,762,000. This year's production will be about $16,000,000. September returns gave $1,350,000 as compared with $1,600,000 for August and $2,000,000 for July.

ELECTRIC ZINC SMELTING.*

FREDERICK T. SNYDER.

(Mineral Point Meeting, September, 1907.)

Your secretary, Mr. Girling, and Mr. George S. Parker, have kindly asked me to tell you something of the efforts that we have been making to improve the metallurgy of zinc. As some of you know, we are responsible for the design and development of the high intensity magnetic separators which are now operating on a large basis at Leadville in Colorado and at Valerdena and Santa Barbara in Mexico, raising the grade of unroasted zinc ore.

It was while confronted by the difficulties of this separation that it occurred to us to strike directly at the root of the principal troubles of zinc reduction (the clay retort) and attempt to put the extraction of zinc on the basis of large stack furnaces. Iron, copper, lead are smelted in bulk in single furnaces, putting through from 200 to 500 tons in each 24 hours. The reason why zinc ore cannot be smelted in an iron or lead blast furnace is well known—the oxygen of the blast burns the reduced zinc black to oxide as fast as it is formed. In such furnaces the object, and the only object, of the blast is to furnish heat by burning the coke in the charge. If this heat be put into the stack by means of an electric current, as it is put into the filament of an incandescent light, the blast is not required and zinc as reduced will remain metal and may be condensed and removed.

Without going into the technical details of this electric stack method, I may say that these furnaces look like an ordinary lead or copper water-jacketed furnace, but are provided with electrodes for carrying in electricity in place of the tuyeres for carrying in a blast. The ore is fed in at the top and is entirely melted down, the residues being tapped as slag. The zinc condenses on the inside of the walls and spelter and runs down and is drained off. No blast is used, all the heat being put in with an electric current.

This solution, simple as it is, required an unexpected length of time to put into practical operative apparatus, but has now reached a form where we are warranted in considering what it means commercially to the mine owner. It is an economic truth that in the long run improvements in process accrue to the benefit of the owners of raw material. Excessive smelting profits soon attract new capital, which reduces the net return to a normal interest basis. But no amount of investment can increase the grade of mineral in a deposit. To render the lower grade available for shipment a reduction must be made in the total cost of extracting and delivering the contained metal to the consumer.

For the purpose of arriving at definite figures, we can consider the result of two plants, each of 25,000 tons annual capacity, operating under equivalent traffic conditions in the Illinois coal field, one using retorts and the other an electric stack furnace. Incidentally it may be remarked that single electric zinc furnaces of 50,000 tons annual capacity now appear practical.

The first cost of the present type of retort plant, including land, buildings and machinery, but excluding working capital, will be some $400,000. The equivalent first cost of the electric stack plant, including steam-driven electric generating machinery, will be substantially the same. Of this $160,000 is the cost of the stack plant and $240,000 the cost of the electric generating plant. Where current can be purchased from an existing power plant, the total cost of the electric stack plant is considerably less than half the cost of a retort plant.

General operating cost items for salaries, interest and depreciation are substantially the same for the retort plant and the electric stack furnace.

The operating cost item of labor in a modern retort plant burning coal with mechanical roasters may be taken at $4 per ton of raw ore. The labor in a stack plant may be kept well under $3 per ton. While this result might naturally be expected from using one compact vertical iron-jacketed furnace in place of 2,000 horizontal clay retors, it also depends on items not so obvious. The area of the stack plant is much smaller and distances over which material has to be handled are less and the continuous treatment admits the introduction of ore-handling machinery. With the electric stack furnace the sulphur does not have to be roasted as low as with retorts; 6 per cent. of sulphur in the electric stack furnace will give as good an extraction of zinc as 1 per cent. sulphur with retort furnaces. This practically doubles the duty per square foot of hearth area of the roasters. The weight of the stack slag is less than one-half the weight of the retort residues and less than one-quarter of the bulk. The results of operating the electric stack furnace are to a large extent independent of the skill of the furnace men, being determined, as in lead and copper smelting, by the metallurgist. This renders the electric stack plant, when starting up or in the event of labor troubles, much less dependent on a supply of specially skilled employees.

Considering fuel, it may be taken that a regenerative retort plant will burn 4,200 pounds of coal per ton of raw ore. Of this 600 pounds will be used in roasting. With the electric stack furnace it takes 1,200 horse-power hours of electricity per ton of raw ore, or 50 horse-power per day of 24 hours. The Fisk street station of the Chicago Edison Company is delivering one horse-power for one hour in electricity at the switchboard with the consumption of less than 1 1-2 pounds of medium grade coal. This amounts to 1,800 pounds of coal per ton of zinc ore and is practically constant, whether the ore is high or low in zinc. So, aside from roasting, the electric stack plant uses one-half the coal that a retort plant uses. As roasting for stack smelting takes less than one-half the coal that roasting for retort work requires, the total coal consumption of the electric stack plant is not more than one-half that of the retort plant. The saving is substantially one ton of coal per ton of ore, amounting to 75 cents.

With the retort plant 800 pounds of reducing material will be used per ton of raw ore; with the electric stack plant 200 pounds, assuming in each case a furnace charge carrying 50 per cent. of zinc. With normal prices this saving amounts to 55 cents per ton of raw ore.

With the electric stack plant there are no clay retorts and all cost items incident to their manufacture are absent. The items involved in the supply of new retorts amount to 40 cents per ton of raw ore. With a stack plant, however, an item of expense is present which is absent in a retort plant. To smelt 25,000 tons of ore will require 100 tons of electrodes, costing $50 per ton delivered, which is equivalent to 20 cents per ton of raw

*Transactions Tristate Mining Association.

ore. Repairs and renewals on iron work and machinery will be substantially the same in each plant.

Summing up these differences of operating costs, it appears that the electric stack plant costs $2.50 less per ton of raw ore to operate than the retort plant.

When we consider the results of operation, the electric stack plant produces results of equal interest. With reference alone to the zinc tenor of the ore, the lower the grade of the ore the more slag produced, and the higher the grade of the ore the higher zinc percentage will the slag contain. Within practical working limits, changes in these items substantially counterbalance each other. In other words, the amount of zinc lost per ton of ore is a fixed amount, independent of the grade of the ore, and is less than 50 pounds per ton of ore. With a retort plant it is also substantially independent of the grade of the ore and with good work may be 150 pounds. The increased recovery due to the stack plant, with zinc at 4 cents, will have a value of $4.00 per ton of ore.

With the electric stack plant, iron in the zinc ore improves the operation of the stack furnace. Up to the point where the percentage of iron equals one-half the percentage of silica, iron is required in the stack furnace charge and has to be added if absent. With an ore running 50 per cent. in zinc, and no lime, this means that an electric stack furnace requires an iron contents of 8 per cent. The higher iron limit with the stack furname, as compared with the retort furnace, will in some properties render it possible to cut out magnetic separation and in any event renders rougher concentration practicable.

With the electric stack furnace, any lead in the ore is reduced and saved separately, at the same time as the zinc. This makes it practicable to do rougher concentrating work and let the lead go in with the zinc, taking out only the gangue. With zinc concentrates containing 3 per cent. of lead, 50 pounds per ton of raw ore, or 2 1-2 per cent., will be saved in electric stack smelting and lost in retort smelting. At 4 cents per pound this is an item of $2. In addition, the lead penalty will be saved to the owner of the ore.

Lime is required in the charge in an electric stack furnace and is permissible in the roasting, as low sulphur is not required. With limey ore this saves the penalty to the mine owner. It also makes a saving of zinc, as with no lime penalty, close work is not so imperative, and less zinc is lost in the mill tailings. These items may reach $1.50 per ton.

Summing up these savings of metals in the electric stack plant over the results of a retort plant, makes a total of $7.50 per ton of shipping ore. This, taken together with the reduction of operating expense, makes a net difference between the retort plant and the electric plant of $10 per ton of ore. This is the direct result of using electricity for heat in place of coal, and involves no other important changes in the present metallurgy of zinc. This $10 does not include the present smelting profit but is in addition to and independent of the profit which the zinc smelter now makes. In other words, a smelter using electric stack furnaces can afford to pay the mine owner $10 more for each ton of zinc ore than can a zinc smelter using retort furnaces.

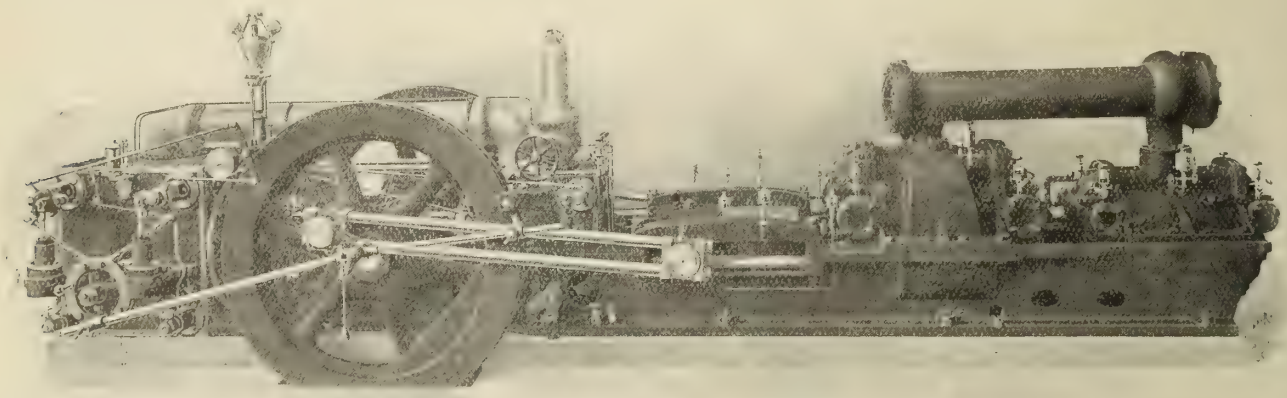
BRITISH JOURNALISTS IN FRONT OF COBALT'S OPERA HOUSE.

A STRAIGHT LINE CORLISS AIR COMPRESSOR.

H. A. Wainwright, M.E.

All engineers recognize in the Corliss engine the most economical means of compressing air by steam power. In the cross-compound type, one horse-power may be produced on from 14 to 16 pounds of feed water per hour, when running condensing, or 20 to 23 pounds non-condensing. But the price of the Corliss unit appears large to many operators, even in regions where the cost of the fuel saved would pay for the entire machine in a short time. Slide valve compressors are, therefore, often installed, which require two to three times as much fuel to do the same work.

The development of an air compressor combining high economy with moderate price has advanced but slowly. In some cases the principles of good mechanics have been distorted to the sacrifice of durability, ease of action and mechanical efficiency, in order to reduce construction costs. In others, various substitutes for the full Corliss valve gear have been offered. It is conceded that some of these compromise machines may fairly claim a certain degree of economy in operation, and that when a test is made under ideal running conditions, they make a good showing as compared with a Corliss compressor.



The conditions of everyday operation, however, are not one time in a hundred like those prevailing in a test. In the latter case, the steam pressure, air pressure, and speed are all constant, whereas in the former the fluctuation in any or all of these factors is likely to be extreme. Sometimes these extremes oppose one another, sometimes they may be high or low together. It is on account of this fluctuation that the Corliss compressor uses so much less coal in the course of a day's run. Its valve gear brings the cut-off in the high and low pressure steam cylinders under the automatic regulation of the governor. There is no wire-drawing of the steam, nor is there throttling action at any time.

A New Type.

A compressor has at last been designed, however, which embodies the economy of the Corliss cross-compound type in a form which permits moderate price without the sacrifice of good engineering. The credit for this achievement belongs to Mr. S. T. Nelson, one of the mechanical engineers of the Sullivan Machinery Company, and the superintendent of its western factory at Chicago. The new machine, known as the "Class WC," is described as a "tandem compound steam, two-stage air, Corliss straight line compressor." To put it differently, tandem compound steam cylinders with full Corliss valve gear on both have been attached to the flywheel end of the standard Sullivan two-stage straight line compressor, the high pressure steam cylinder occupying the same position as the single Meyer valve cylinder of the "WB-2" machine. The photograph shows the arrangement.

Design of Steam Cylinders.

The high pressure steam cylinder is of special design, to make room for the Corliss valve bonnets and dash pots between the cylinder and flywheels, and in order to do this, the steam chest is offset to one side. The dash pots for closing the steam valves are set directly on the main frame and the motion rods for operating the exhaust valves are arranged in the usual way, except that they are longer. Back bonnets are provided as usual and the frame is so designed that either one or all of the steam or exhaust valves may be removed without disturbing the valve setting. The low pressure steam cylinder is attached to the end of the frame by means of rigid distance pieces. The bottom feet of this cylinder are on the same level with the bottom of the main frame, and its weight is supported by an extension of the foundation. Practically the same pattern is used for making this cylinder that is used for the Sullivan cross-compound Corliss machines. It embraces all of the regular valve gear usually furnished with the latter type of machine.

There are no adjustments between the flywheels and the steam cylinders which require attention while the compressor is in operation. The piston rod stuffing boxes are packed with fibrous metallic packing, which needs only occasional care. The main bearings and other parts which cannot be oiled by hand while running, are lubricated by a system of pipes, leading from a cluster of oilers mounted at a convenient point, so that the engineer can tell at a glance when one of them is empty.

The eccentrics for operating the valve gear on both the high pressure and low pressure steam cylinders are located on the crank pin on the outside of the flywheels, so that they are easily accessible. The eccentrics, rocker arms, valve stems and all connections located between the flywheels or between the main bearings on the "WB-2" type are dispensed with in the "Class W.C." The governor pulley is all that is located on the shaft in their place. The removal of these parts allows the use of two piston rods between the high and low pressure steam cylinders, which are necessary in order to straddle the

crank shaft, which is kept in its original position in line with the cylinders.

Steam Regulation.

The governor is located on a separate mounting, and is a combined speed and pressure regulator. In appearance, it is of the Corliss fly-ball type, but it operates in unison with the pressure attachment. Either may also operate independently of the other when necessary.

The exhaust steam from the high pressure cylinder is carried around the outside of the cylinder barrel to the top by a passage cast with the cylinder, and discharges into a covered receiver pipe, extending from the top of the high pressure to the top of the low pressure cylinder.

Air Efficiency.

From the standpoint of air efficiency, this compressor takes the same high rank as the class WB-2 machine. The inlet valves on both low and high pressure cylinders are of the semi-rotary pattern, positively driven by motion rods from an eccentric pin on the engine flywheel. The action of these valves permits the cylinder to fill itself completely at each stroke, with air at the temperature of the atmosphere, and there is no wire-drawing or leakage. The discharge valves are of the automatic poppet type, so arranged as to reduce clearance losses to a minimum. They are removable by hand, together with the valve seats, so that the maintenance of a perfect fit is a simple matter.

The ideal of isothermal compression is approximated in these machines by means of unusually adequate cooling apparatus. This consists of heavy water-jackets on the air cylinders, and an inter-cooler of ample proportions, containing copper water tubes, across which the air must pass several times in its course from the intake to the discharge cylinder.

The "Class WC" compressor is built very substantially, being self-contained on its heavy frame and on the distance pieces connecting the two steam cylinders. These parts are sufficiently massive to sustain the low pressure cylinder of themselves, without the aid of foundations, if such a necessity should arise.

The straight-line type unites with its well-known advantages of engineering excellence the features of low weight, simplicity, and minimum foundations, as compared with duplex machines. These qualities render it possible to sell these compressors at a comparatively low price, to transport them readily and at small expense, and to erect them without elaborate and costly preparations at the desired site. They are built at present in sizes ranging from 909 to 2,450 cubic feet of free air per minute.

The Delaro plant of the Delaro Mining and Reduction Company is in full operation. It is designed to treat arsenic and cobalt ores. Arsenical ores are its specialty. A full description of the plant will appear in our issue of November 15th.

GROUP OF MINERS—FOSTER MINE, SUDBURY, ONT.

MINING OPERATIONS IN QUEBEC FOR THE YEAR 1906.

The report of the Superintendent of Mines for Quebec has just appeared. In summing up the year's production, Mr. Obaliski notes that production has risen from $3,755,000 in 1905 to $5,500,000 in 1906. Interesting discoveries of gold-bearing quartz are reported as having been made near Lake Opasatica, north of the County of Pontiac. The existence of cobalt ores at Chibogomo is taken as a hopeful sign that the great northern region from Temiskamingue to Mistassini when opened up by railways will prove a rich field.

In 1906 the country to the north of the County of Pontiac was explored. A map of this county accompanies the report.

The following are the principal mining and smelting operations reported for 1906:—

The Radnor and Drummondville charcoal iron furnaces produced 7,851 tons of pig iron, valued at $177,643. The ore smelted was principally bog ore. In connection with iron ores the report calls attention to the adaptability of the Gröndal process of concentrating and agglomerating iron ores to the magnetic sands of Quebec.

The Canada Paint Company and the Champlain Oxide Company produced 1,962 tons of calcined ochre, worth $19,620.

Of chrome iron ore the output was 8,961 tons, valued at $91,834, classified thus:—

1st class ore	417 tons	$ 4,743
2nd class ore	4,054 tons	34,375
Concentrates	4,490 tons	52,716
		$91,834

The first class contains about 50 per cent. sesquioxide of chrome, the second class about 45 per cent., and the concentrates 49 to 54 per cent. Prices were low, the 50 per cent. ore being worth $13 at the mine and the 45 per cent. $9.

The only copper mines operating were the Eustis and Nicholls mines at Capelton. The production was 32,527 tons, of which 24,642 tons were shipped to the United States and the remainder treated at Capelton for sulphuric acid and matte by the Nichols Chemical Company, which produced 374 tons of matte, containing 53 per cent. of copper. Some good prospects of copper ore are mentioned.

In lead, zinc and silver very little was done. The Wright galena mine and the zinc and galena mines of Calumet Island showed symptoms of activity.

Gold production was nil. Quebec may, however, become a modest contributor to our gold supplies very soon.

The production of asbestos has again increased, and prices have continued high. Nearly all the mines are in operation and new companies have been formed. At Thetford the King, Bell, Johnston and Beaver mines haves been in regular operation and have increased their output. The Shawinigan Water Power Company now supplies electric power to the Thetford companies.

The underground work of the Bell Asbestos Company is a new feature.

According to the company's reports, the total production of asbestos for 1906 was as follows, in tons of 2,000 pounds:—

	Tons.	Worth.
1st class crude	1,477	$324,380.00
2nd class crude	2,450	321,355.00
Fibre	18,542	815,962.00
Paper stock	39,906	681,956.00
Total	61,675	$2,143,653.00
Asbestic	21,119	18,875.00
Total	82,794	$2,162,528.00

Two thousand men, receiving $750,000 in wages, were employed for periods of from eight to twelve months. All the asbestos got out is sold at once. This industry is thus very flourishing, and the increased production was about 25 per cent. more than last year.

The production, exclusive of asbestic, for the previous years was as follows:—

	Tons.	Worth.
1904	35,479	$1,186,795.00
1905	48,960	1,475,450.00
1906	61,675	2,143,653.00

The amber mica industry has prospered. Talc, phosphate and graphite are in statu quo.

Kind of Minerals. (Tons of 2,000 lbs.)	Wages paid.	No. of workmen.	Quantities shipped or used.	Gross value.
Bog iron ore	2,200	120	18,331	61,175
Chromic iron	37,200	110	8,961	91,834
Copper ore	95,000	250	32,527	176,681
Asbestos	747,600	1,950	61,675	2,143,653
Asbestic		...	21,119	18,875
Mica (lbs.)		...	530,086	168,887
Calcined ochre	12,000	56	1,962	19,620
Phosphate		...	575	4,025
Graphite	23,800	83	125	8,300
Slate (squares)	16,000	50	5,469	24,446
Flag stones (yods.)	1,700	50	2,400	2,050
Cement (barrels)	136,000	300	405,103	625,570
Granite (cb. yds.)	238,761	653	51,873	560,236
Lime (bushels)	33,500	124	556,000	96,000
Bricks	300,000	1,462	94,000,000	525,000
Tiles and pottery.		...		270,000
cubic yards)	155,882	515	97,710	223,580
Totals	1,829,443	5,679		5,019,932

Limestone (cubic

Important changes have been made in the mining law with the view of facilitating its application, but without altering the principle.

On the 7th February, 1907, an order-in-council was passed classifying all minerals, except building materials, as metals. The price of mining lots was changed as follows: Superior metals, $10 per acre when more than 20 miles from a railway, and $20 when under that distance; inferior metals, $2 and $4 respectively. The fee for mining licenses was raised to $10. An amendment to the mining law was submitted to the Legislature, and

came into force on the 23rd March. It fixes the maximum area of land to be granted under a prospecting license to the same person, within a radius of 100 miles, at 25 square miles or 30 lots of 100 acres. Not more than 400 acres of mining lands can be sold to any one person in the same year within a radius of 100 miles. Miners or owners of inferior metals under mining patents have the first right to the purchase of superior metals.

A fee of $10 is exacted for registration of all transfers of mining rights.

Every application for a prospecting or for a mining license must be accompanied by the required fee and give an accurate designation or description of the land. The application must be addressed to the Honourable Minister of Mines. Reports must be sent in on the expiration of licenses.

COAL MINED BY MACHINES.

One of the notable features presented by the statistics of bituminous coal production in 1906, as in 1905, was the increase in the use of machines and in the quantity of machine mined coal. The percentage of increase in the production of machine mined coal in 1905 over 1904 was greater than the percentage of increase in the total production. In 1906 the quantity of machine mined coal was 15,451,075 short tons greater than in 1905, while the total production of bituminous coal increased 21,534,643 tons, showing that 72 per cent. of the increase in 1906 over 1905 was in the machine mined produced. The statistics also show that the average output for each machine in use increased from 10,258 tons in 1904 to 11,258 tons in 1905, and to 11,638 tons in 1906.

The total quantity of coal produced by the use of machines in 1906 was 118,847,527 short tons, as against 103,396,452 short tons in 1905 and 78,606,997 short tons in 1904. The increase in 1906 was 15,451,075 short tons, or 15 per cent. The increase in 1905 over 1904 was 24,789,455 short tons, or 31.5 per cent., while that of 1904 over 1903 was only 623,103 tons, or 0.81 per cent. The number of machines in use increased from 7,663 in 1904 to 9,184 in 1905, and to 10,212 in 1906.

The percentage of the machine mined tonnage to the total production in the States in which machines are used has increased steadily each year. In 1899 this percentage was 23; in 1900 it was 25.15; in 1901, 25.68; in 1902, 27.09; in 1903, 28.18; in 1904, 28.78; in 1905, 33.69, and in 1906, 35.1.

Of the 10,212 machines in use in 1906, 5,911, or 58 per cent. were of the pick or puncher type; 4,144, or 40.5 per cent. were chain-breast machines, and 157, or 1.5 per cent., were long wall.

In the number of machines in use and in the amount of machine mined tonnage, as in the total production of coal, Pennsylvania stands far in the lead, with 45 per cent. of the number of machines and 45.6 per cent. of the machine-won product in 1906. The amount of coal mined by machines in Pennsylvania increased from 49,335,660 short tons in 1905 to 54,146,314 short tons in 1906. West Virginia ranks second in the number of machines in use, with 1,322, closely followed by Ohio, with 1,255. The position of these two States is reversed in the amount of coal mined by machines, Ohio's production by machines in 1906 being 20,004,416 short tons, while West Virginia's was 15,565,113 tons. Ohio stands first in the percentage of machine mined coal to the total product. Illinois, the third State in coal producing importance, ranks fourth in the production by the use of machines. Kentucky, the eighth in rank among the coal producing States, takes fifth place in the number of machines used and machine mined tonnage, and second in the percentage of the machine mined coal to the State total. Indiana comes next to Kentucky in the use of mining machines. The six States mentioned contribute over 90 per cent. of the total machine mined coal.

As a rule an increase in the use of mining machines is accompanied by an increase, both for the year and for the day, in the average production per employee. Striking exceptions, however, are shown by Alabama and Colorado. In Alabama the percentage of machine mined coal to the total decreased from 13.36 to 12.52 and the production per man remained the same; in Colorado the machine percentage decreased from 14.14 to 13.22, and the tonnage per man increased from 3.14 to 3.32.

TITANIUM.

Titanium, although generally spoken of as one of the rare elements, is really one of the more common ones. According to Dr. F. W. Clarke, chemist of the United States Geological Survey, it forms 0.43 per cent. of the surface rocks of the globe, and is much more plentiful than lead, zinc, copper, and other metals classed as "common." A great many schists and gneisses carry titanium, and it is found in appreciable quantities in clays—not only surface clays, but also those that have been dredged from the sea bottom.

Many iron ores contain titanium, and ores containing one per cent. or more have generally been avoided by miners, owing to difficulties experienced in smelting, due to thick, pasty slags; but it is claimed that when properly handled tintaniferous ores give no more trouble with slags than other iron ores. It is said that steel and iron made from iron ore smelted in a blast furnace running on the titaniferous ores of the Adirondacks took a prize at the London Exhibition of 1851. The addition of titanium to cast iron greatly increases its strength, and an alloy called ferro-titanium is now manufactured at a number of places in this country and Europe for use as an agent by which to introduce the tintanium into the iron. It is believed that titanium is used by various firms to increase the tensile strength and elastic limit of steel, and although much secrecy is maintained concerning the matter, it seems probable that some steels that are imported as vanadium steels are in reality titanium steels. As titanium, unlike other metals used for the same purpose, such as vanadium, molybdenum, and tungsten, is plentiful and cheap, its successful use in steel hardening should establish a large market for it.

Several firms are now experimenting with titanium filaments in incandescent electric lamps, but the reduction of titanium to a metal is so difficult that the lamps have not yet been extensively placed on the market.

Titaniferous magnetite and titanium carbide, the titanium of which is derived from rutile, are used as electrodes in arc lamps. When one electrode is made of these substances a block of carbon is used for the other. The best known rutile deposit in this country, the one which produced the greater part of the titanium output in 1906, is at Roseland, Nelson County, Va. A few pounds were produced in Chester County, Pa., where the product is said to occur in comparatively large crystals and to be very pure.

A new use for titanium as a detector of minute quantities of fluorine has been worked out in the chemical laboratory of the United States Geological Survey by George Steiger.

COAL BRIQUETTING IN THE UNITED STATES.

Paper read at Toronto Meeting of A.I.M.E.

(Continued from last issue.)

Early in 1906 the Renfrow Briquette Machine Company was incorporated under the laws of the State of Missouri with $1,000,000 capital; W. C. Renfrow, president; J. M. Smith, secretary and treasurer, and E. D. Mizner, superintendent. This concern is a close corporation, and the company will not offer for sale any machines until after the Kansas City plant has proved successful. As far as can be learned, the construction of the Kansas City plant was brought about by the willingness of its presidentfi Mr. J. H. Durkee, to accept a Renfrow machine without a guarantee, simply on the strength of the work done at the coal testing plant. There are, of course, still some difficulties to be overcome, as in the case in the operation of any new plant, but in the main the mechanical operations of this plant are satisfactory, and the Renfrow Company has been able to deliver what it contracted to do. Financial difficulties have threatened the life of the plant under the present organization, but Governor Renfrow has affirmed that he will not allow this plant to fail for this reason. A contract has been signed to deliver one of the machines to a company at Detroit, but under the terms of the contract no date is fixed for the delivery of this machine, and no guarantee from the Renfrow Company has been acquired. Governor Renfrow is also authority for the statement that the Detroit machine will not be delivered until after the Kansas City plant has been successfully operated and put on a commercial basis.

The Renfrow Briquette Machine Company has no plant of its own, but has under consideration the establishment of a factory in St. Louis. All of the other machines above mentioned were built in machines shops under contract. The Kansas City machine was built by the Excelsior Tool & Machine Company at East St. Louis, and all of the other machines by the Ramming Machine Company, of St. Louis.

North Dakota.

During 1905 ex-United States Senator W. D. Washburn, president of the Washburn Lignite Coal Company, erected a small plant at Minneapolis for experimental work in the briquetting of North Dakota lignite. The plant was too small to be operated successfully from a commercial standpoint. Several hundred tons of briquettes were made on this press without the use of a binder. The briquettes proved a satisfactory fuel for domestic purposes and for stationary boilers, but were not adapted to locomotive use, because the heavy exhaust draft in the locomotive has the effect of disintegrating the briquette before combustion and causes the throwing off of large sparks. This small experimental plant represents the extent of Senator Washburn's efforts to briquette North Dakota lignites.

Mr. Robert L. Stewart, also of Minneapolis, who is interested in lignite properties near Kenmare in Ward County, reports that he has been conducting a series of experiments with a view to the briquetting of this fuel, and as a result of his investigations the American Briquetting & Manufacturing Company has been organized, which contemplates the construction, during the present year, of a briquetting plant in North Dakota, convenient to the lignite deposits, the plant to have a capacity of 1,000 tons of briquettes per day. Mr. Stewart says that the briquettes can be manufactured at a cost not to exceed $2 per ton f.o.b., this cost including the expense of mining the lignite and delivering it to the briquetting plant.

Texas.

Three companies have been organized in Texas recently for the purpose of briquetting the lignites which occur in great abundance through the eastern part of that State. These are the International Compress Coal Company, of Houston; the American Lignite Briquette Company, of San Antonio, and the Eureka Briquette Company, of Rockdale. The plant of the last mentioned company has been erected and is ready for operation at the time of the writing of this report, except for the fact that the drying apparatus has been found too small, and the plant has been shut down pending the erection of a larger drier. The details of the plant have not been obtained.

The American Lignite Briquette Company, while incorporated at San Antonio, will locate its plant at Rockdale, and the plant will be operated in connection with the lignite mines of J. J. Olsen & Son. The company has purchased a press made by the Klein Briquette Company, of St. Louis, and the plant will probably be in operation by the time this report is ready for distribution.

The International Compress Coal Company has been negotiating for the construction of a plant, but no actual building had been begun at the time of writing this report. All of these plants expect to use asphaltic pitch made from heavy Texas oil.

Florida.

In September, 1905, the Orlando Water & Light Company, of Orlando, completed the installation of a plant for the treatment and briquetting of peat, which occurs abundantly in the low-lying lands of Florida. The plant is located about 3 miles from Orlando, on the border of a peat bog, from which its supply is drawn. As originally installed, this plant consisted of a macerating machine or pug mill, in which the fibre of the peat is entirely destroyed, and a brick press. The briquettes, as they came from the press, were about the size of an ordinary building brick, and when dried in the sun shrunk to about one-fourth their former bulk and lost from 75 to 85 per cent. in weight. The briquetting feature of the plant was abandoned in the summer of 1906, as it was found that this part of the work represented 75 per cent. of the total cost, and that a satisfactory fuel could be made without briquetting. The method of treatment at the present consists simply of "machining" the peat in the pug mill and dumping it in masses of several hundred tons. As the peat dries it shrinks and cracks into large irregularly rectangular blocks, which are broken off from the heap and stored. When thoroughly dried these blocks make a good hard fuel, which, it is stated, may be used for both locomotive and stationary boilers, for household purposes, and for the manufacture of gas. Tests of the machined peat for producer gas at the United States Geological Survey coal testing plant gave excellent results.[13]

The machine used at the Orlando plant was built by the Moore & Wyman Elevator & Machine Works, South Boston, Mass., under patents issued to the late T. H. Leavitt, of Boston.

---

[13]Report on Peat, by M. R. Campbell, *U. S. Geological Survey, Mineral Resources of the United States,* 1905, pp. 1319 to 1322.

USE OF THE DIVINING ROD.

Numerous devices are used throughout this country for detecting the presence of underground water—devices ranging in complexity from the forked branch of witchhazel, peach or other wood to more or less elaborate mechanical or electrical contrivances. Many of the operators of these devices, especially those that use the home-cut forked branch, are perfectly honest in the belief that the working of the rod is influenced by agencies—usually regarded as electric currents following underground streams of water—that are entirely independent of their own bodies, and many uneducated people have implicit faith in their ability to locate underground water in this way.

In experiments with a rod of this type, one of the geologists of the United States Geological Survey found that at points it turned downward independently of his will, but more complete tests showed that the down-turning resulted from slight and—until watched for—unconscious changes in the inclination of his body, the effects of which were communicated through the arms and wrists to the rod. No movement of the rod from causes outside the body could be detected, and it soon became obvious that the view held by other men of science is correct—that the operation of the "divining rod" is generally due to unconscious movements of the body or of the muscles of the hand. The experiments made show that these movements happen most frequently at places where the operator's experience has led him to believe that water may be found. The uselessness of the divining rod is indicated by the facts that the rod may be worked at will by the operator, that he fails to detect strong currents of water running in tunnels and other channels that afford no surface indications of water, and that his locations in limestone regions where water flows in well-defined channels are rarely more successful than those dependent on mere guesses. In fact its operators are successful only in regions in which ground water occurs in a definite sheet in porous material or in more or less clayey deposits, such as the pebbly clay or till in which, although a few failures occur, wells would get water anywhere.

Ground water occurs under certain definite conditions, and as in humid regions a stream may be predicted wherever a valley is known, so one familiar with rocks and ground water conditions may predict places where ground water can be found. No appliance, either electrical or mechanical, has yet been successfully used for detecting water in places where plain common sense or mere guessing would not have shown its presence just as well. The only advantage of employing a "water-witch," as the operator of the divining rod is sometimes called, is that skilled services are obtained, most men so employed being keener and better observers of the occurrence and movements of ground water than the average person.

Tungsten.

During 1906 the prices paid for tungsten ore ranged from $5 to $9 per unit for the contained tungsten trioxide. The market for tungsten ores is expanding, and seems now to be as sure as for the staple ores. Buyers have had difficulty in obtaining supplies for future deliveries. As a filament in an incandescent lamp, metallic tungsten has been given a new use during the year. In this it has proved remarkably successful.

CANADIAN COINS.

By statute the weight of silver, copper or bronze coins for circulation in Canada are fixed as follows:—Silver coins, from the fifty cent piece down to the five cent piece, must be composed of thirty-seven fortieths of fine silver and three fortieths of copper, a millesimal fineness of 925.

Name of coin.	Weight in grains; subject to testing provisions.
Fifty cents	179.3336 grains
Twenty-five cents	89.6668 grains
Ten cents	35.8667 grains
Five cents	17.9334 grains

The pieces of fifty cents are to be weighed separately with a remedy of 1.024 grains.

The pieces of twenty-five cents are to be weighed separately with a remedy of 0.594 grains.

The pieces of ten cents are to sampled in groups of one dollar's worth and weighed against the standard dollar weight of 358.6673 grains with a remedy of 2.844 grains. The prices of five cents are to be sampled in groups of one dollar's worth and weighed against the standard dollar weight of 358.6673 grains, with a remedy of 3.485 grains.

The one cent piece is to be composed of mixed metal, of copper, tin and zinc in the following proportions:—

95 per cent. of copper.
4 per cent. of tin.
1 per cent. of zinc.

Its weight will be 87.5 grains, with a testing provision or remedy of 140 grains. It is to be sampled in groups of eighty and weighed against a weight of one pound avoir dupois.

VANADIUM IN THE UNITED STATES.

Vanadium, one of the rare metals, is used principally for hardening steel, especially in connection with chromium. The addition of a very small quantity of vanadium to chrome greatly increases its tensile strength, affording a steel that is much used in the axles and other parts of the higher priced automobiles, as well as for the stronger parts of other machines.

Roscoelite, a vanadium mica, occurs in commercially valuable deposits in Southwestern Colorado, where it was mined and reduced in 1906. The ore contains about 2 per cent. of the metal. The product, an iron-vanadium compound, is shipped from the reduction plant at Newmire to Niagara Falls and smelted by electricity to a ferro-vanadium containing about 25 per cent. of vanadium and selling for $5 per pound of the contained vanadium. Another Colorado plant, at Cedar, produces vanadium as a by-product in the concentration of carnotite ores, about 20 per cent. of the concentrates being vanadium oxide. Vanadinite and other ores of the metal are found in small quantities in Colorada and Utah, as well as in the Southwestern States.

Vanadium salts are used in medicine, in ink and dye-making, in coloring glass, and in chemistry. Vanadic acid is used as a pigment, affording a golden bronze that is very little inferior to true gold bronze.

The occurrence and production of vanadium and other rare metals in the United States is discussed by Frank L. Hess, geologist, in an advance chapter from "Mineral Resources of the United States, Calendar Year 1906," just issued by the United States Geological Survey.

THE ORIGIN OF DEPOSITS OF PYRITES.

(Toronto Meeting, 1907.)

By A. B. Willmott, Sault Ste. Marie, Ont.

On studying the literature concerning the origin of deposits of pyrites, it becomes evident that there are several theories, each with strong supporters, and that even for the same deposits observers are not agreed. For a number of our deposits in Ontario the mode of origin seems to be fairly clear. This paper deals with the occurrences in Ontario, and only incidentally with others.

The four important theories regarding the origin of pyrites may be tabulated as follows:—

1. Impregnated beds.
2. Veins.
3. Sedimentary beds.
4. Magmatic segregations.

The first assumes that iron and sulphur as a soluble salt has found its way into porous beds, and been there precipitated as the sulphide. The country rock has in most cases been more or less replaced. Fracturing of the rock has promoted circulation. The mode of formation is similar in most respects to the second or vein deposits, and there are cases where the two methods are indistinguishable. The third theory assumes the precipitation of iron sulphide from solution as a bed at the bottom of shallow water. Other chemical and mechanical sediments occur above and below such beds. This theory in common with the first and second, pre-supposes the iron and sulphur in the form of a soluble salt, and precipitation brought about through a change in conditions. The fourth theory supposes that the iron sulphide has separated out of a cooling igneous mass. Several physical principles are suggested to account for the segregation. The following citations and quotations are given to illustrate current opinions.

Beck[1] in his treatise on ore deposits cites no instance of a pyrites deposit formed by sedimentation, magmatic segregation, or deposition in a vein. Under his division of Epigenetic Ore Deposits in Stratified Rocks, exclusive of veins, he gives a number of examples. These are sub-divided into those occurring (a) In crystalline schists; (b) as impregnations within non-crystalline strata. Both varieties are considered to be due to ore-bearing solutions depositing their load in porous strata. The deposits at Bodenmais, Germany; Sain-Bel, France; Ducktown, Tennessee; and severals in Norway are described as examples of the first. As examples of impregnations within non-crystalline strata, Beck mentions the deposits of Rammelsberg and Meggen, Germany, and of Rio Tinto and others, Spain. Beck quotes other authors holding different views on some of these deposits, whose opinion he, however, controverts.

Beck[2] sums up his conclusions upon epigenetic ore deposits as follows:—

"The two fundamentally opposite genetic views, whose rivalry at the present day is keener than ever before in the history of economic geology, have been presented and weighed one against the other in the descriptions which we have given of numerous stratified deposits of sulphide ores of the most diverse composition and age.

"The sedimentary theory assumes that strata consisting of sulphide ores, sometimes of considerable thickness, have been deposited on the bottom of the ocean or sometimes of a shallow coastal sea, exactly like limestone or rock salt beds, or at any rate purely chemical precipitates of such sulphide ores were deposited by sea water in small particles associated with the normal sediments.

"The other is the infiltration theory, according to which such deposits are due to a subsequent mineralization of ordinary sediments, at a much later geologic period, by means of an infiltration of ore solutions derived from fissures.

"We believe that the reader must have gained the conviction that the conditions of structure and position actually observable argue, in most instances, rather in favor of the second hypothesis. This is particularly true of the beds of sulphide ore in crystalline schists. The lack of constancy of position in otherwise uniformly stratified ore deposits, the limitations of the beds to portions of rock strongly influenced by dislocations and traversed by eruptive rocks, the occasional occurrence of offshoots (ueberschneidungen) at the boundary of such ore bodies with the sediments, the occasional presence of vein-like spurs and stringers, and above all the miscroscopic relations of the ores to the other rock constituents, which often point to a later segregation of the metallic compounds—all these speak in favor of the infiltration theory."

Beck then considers to what extent chemical precipitates of sulphidic ores are now being made, and concludes that there is nothing now forming which would account for the vast pyrite accumulations of earlier ages.

Kemp[3] groups "Pyrite Beds" with magnetic deposits, which they closely resemble in form and occurrence. "Some pyrites lenses may have accumulated in a way analogous to the bog ore hypothesis, cited under 'Magnetite,' but instead of the iron being precipitated as the oxide, it has probably come down as the sulphide from the influence of decaying organic matter, and has subsequently shared in the metamorphism and solidification of the wall rock. At the same time it must be admitted to be an obscure point. By many they are thought, with more reason, to have originated like a bedded fissure vein whose overlapping lenticular cavities have been veins are on lines of dislocation beyond question. Reformed by the buckling of folded schists. The Ducktown placements of pinched beds of limestone are always to be considered, and the presence of intruded dikes, though disguised by metamorphism, is always to be kept in mind."

In the following chapter he describes pyrite or pyrrhotite beds (veins) with intermingled chalcopyrite, and writes: "Whether the deposits are true beds or veins parallel with the foliation is as yet a matter of dispute. The resemblance to magnetite suggests a bed and this view is generally taken by German writers. The California mines occur closely associated with the auriferous (pyritous) quartz bodies, which are always esteemed veins. But as detailed knowledge increases, it is more and more appreciated that the ore bodies are mostly if not entirely veins, and have been deposited along lines of dislocation."

J. H. L. Vogt has been the leading exponent of the theory of magmatic segregation of pyrite deposits, and also of pyrrhotite. Doctors Coleman and Barlow, of our own Institute, are strong supporters of this origin of our Sudbury pyrrhotites.

From the quotations given it is evident that the present tendency is to consider all pyrite deposits as veins or impregnated beds. In this paper the position is taken that for many of our Ontario deposits a sedimentary origin must be predicated. If some deposits are undoubted sediments it probably follows that at least some of the foreign deposits which have been explained both on

the sediment and impregnation theories were made in the former way.

Turning now to the Ontario deposits, several may be considered in detail. Among the most important is that near the Helen iron mine, Michipicoten. The ore is a mixed hematite and limonite, which in places holds pockets of fine granular pyrites resembling artificial conand is free from impurities. The pockets found vary from a few cubic feet up to chimneys 20 feet across and 100 feet high. The line of separation between the pyrites and hematite is usually very marked. At times there is a gradual transition. At points in the hematite mine hard ore is found carrying considerable intermixed pyrites. Usually this ore is somewhat banded and quite silicious. North of the hematite ore body there is several hundred feet of banded hematite and chert standing almost vertical. To the east of the iron mine a steep hill rises 400 feet, along the brow of which a band of impure cherty siderite is seen. Scattered through this siderite is a considerable amount of pyrites. The siderite weathers much more rapidly than the pyrites.

On the west the iron ore now being mined is bounded by a diabase dike which crosses the iron formation nearly at right angles. West of the ore body there was originally a small pond known as Boyer Lake. This pond was about a quarter of a mile long, hardly as wide, 133 feet deep, and rock-rimmed throughout. Diamond drill holes have shown, beneath forty feet of mud in the bottom of this lake, 140 feet of pyrites fines. Exploration is not complete, but a pocket of over 100,000 tons has been shown. The only explanation of the origin of this rock-rimmed basin is by solution.[4] The siderite, with its pyrites, which is found at both the east and west ends of the lake, undoubtedly was continuous, and has been removed. The lose granular pyrites can best be accounted for as a residual product. That the pyrites is much more stable than the siderite is abundantly proved.

Adjoining Boyer Lake and along the strike of the iron formation is another pond, Sayer's Lake, of similar size and description. On the north side of the lake a railway cutting shows a small deposit of pyrite, pyrrhotite, and carbonaceous shale. On the south side a short tunnel discloses pyritic quartz rock, which in places is almost pure pyrites. This material resembles the pyritic quartz mentioned before as occurring in the iron ore body, except for the lack of hematite. Where the outlet of Boyer Lake has been lowered a similar silicious pyrite, carrying 30 to 35 per cent. sulphur, occurs.

Everywhere along the Michipicoten iron range similar associations are found. A mile west of the Josephine siderite with large amounts of pyrites occurs. Near this a railway cut shows a lens of silicious pyrites carrying 25 per cent. sulphur. It is enclosed within the iron formation, and is undoubtedly part of it. One mile east of the Josephine banded silicious pyrite occurs. At Paint Lake oxidation of silicious pyrites has given rise to a bog deposit on the shore of the lake. For further descriptions reference must be made to the writings of Coleman, Bell and myself in the reports of the Bureau of Mines[5] on the Michipicoten Iron Range. The great majority of these numerous occurrences along the iron range are too lean to be of commercial value as sulphur ores.

The Goudreau Lake deposits in Township 27, Range 26, west of Missanabie on the Canadian Pacific Railway, are perhaps the largest in Ontario. Comparatively little work has been done, but from the known areas, and allowing a depth of only 100 feet, one million tons of pyrites exist. Much of this may be too low in sulphur to be of commercial value, but the prospect is very encouraging to the owners. The deposits are six in number and cover an area two miles in length by one in width. The country rocks are mainly Keewatin schists with some intruded greenstones. Characteristic iron range rocks also occur. The richer pyrite bodies are marked by depressions 10 to 50 feet in height. The smaller ones are only a few feet across; the larger, as on the Bear claim, are 250 feet. In some cases these depressions are roughly circular or oval as at deposit A; at others they are long and narrow as at C, where the depression is 500 feet long, and about 40 wide. Some little ponds in the vicinity of several of the deposits may fill the depressions due to weathering of pyrites, but this is not yet proven. The resemblance of these weathered pits on a small scale to Boyer Lake near the Helen is striking.

The ore is silicious, and granular silica similar to the iron range rocks, is frequently found. The character of the ore is exactly like the better quality of hard pyrites found at the Helen. Bands of siderite have not yet been noticed, but at several of the deposits crystalline limestone occurs near the pyrite. A diamond drill hole, put down at an angle of 42 degrees under deposit A, passed through three narrow bands of pyrites separated by calcareous schist, before reaching the main deposit 96 feet thick. A vertical hole from the bottom of the pit, after passing through a few feet of broken and oxidized material, went through four feet of ore higher in sulphur and much less dense than the usual ore. Either it is a layer from which the silica has been dissolved, or a bed formed by the precipitation of solutions from the gossan above.

Typical material from these deposits analyzes as follows:—

Silica	6.00 p.c.
Iron	44.36
Sulphur	40.28
Lime	.25
Magnesia	.53
Copper	Trace
Arsenic	Nil.
Lead	Nil.
Zinc	Nil.

That these deposits are only an extreme phase of the Helen iron formation is, I think, admitted by all who have seen them. The agreement is founded on the similarity of the adjoining rocks; the presence of banded chert and magnetite, though only in a small degree; the similarity of the silicious pyrites. The silicious pyrites along the south side of Sayer's Lake at the Helen, and the deposits along the south side of the lake at deposit B, Goudreau Lake, are extremely similar in appearance and mode of occurrence.

At Kaministiquia, 20 miles west of Port Arthur on the Canadian Northern Railway, the Davis Sulphur Ore Company opened a shaft on a pyrite bed. Here, also, the accompanying rocks are those typical of the iron formation as it occurs all through Ontario in the Keewatin. Hand specimens of this ore can be exactly matched at Michipicoten. Undoubted iron range rocks occur in close proximity.

At Strawhat Lake, near Atikokan, on the Canadian Northern Railway there is another occurrence of pyrites resembling those at Goudreau Lake. This deposit was originally opened by prospectors who were searching the iron range for iron. That the deposit is part of the iron range cannot be doubted. It must have been formed

with it, though possibly secondary concentration might be argued.

Near Schrieber, on the north shore of Lake Superior, is a pyrite deposit of a different character. The ore is associated with an eruptive diabase, and is considerably mixed with pyrrhotite carrying small amounts of nickel and copper.

Associated with the iron ranges in the Temagami Reserve are several belts of pyrites. These have been described by Professor Miller[6], and it need only be stated that in character and associations they resemble other pyrite beds found with the Keewatin iron formations. Several openings have been made at points on Temagami Lake, but the ore has proved rather too low in sulphur. In this it resembles the great majority of occurrences along the iron ranges. Only in places has the pyrites been accumulated sufficiently free from quartz to be of value. At these places, naturally, the resemblance to the pyritous chert of the iron ranges has been so much modified that it is not easy to recognize the connection. The deposit at Net Lake is, I believe, only a richer part of the pyritous cherts of the Temagami iron range. To be certain one should trace out the belt which I have not done.

In Hastings County are a number of deposits, several of which were originally opened for hematite iron. The deposits occur a sbeds in various green schists and are frequently associated with limestones. The boundaries of the ore bodies are not always distinct, but the ore gradually diminishes outwards until too poor to be of value. Parallel beds occur. The ore contains more lime and less silica than the deposits in Northern Ontario. The writer has not observed the pyritous chert of the iron ranges anywhere in the vicinity. The enclosing rocks are, however, very similar to those of Goudreau Lake.

In Lanark County there is a deposit differing from those so far described. It occurs in crystalline limestone and has the appearance of a vein rather than a bed. The crystals of pyrite are frequently large, well formed, and very pure.

Other large deposits in Ontario, as those at Nickel Lake and Dinorwic, the writer has not seen, and so will pass over; also other pyritous cherts of frequent occurcentrates. The ore runs 40 to 50 per cent. in sulphur, rence, but not differing from those already described.

The large number of deposits in Ontario and the more important in size, are, as shown above, closely associated with the iron ranges. Following along the strike, pyritous chert succeeds sideritic chert and is succeeded by silicious pyrite. More commonly these changes are noticed in crossing the strike. Cross sections of the range made by diamond drills show many alterations—banded cherts and hematite, pure hematite, pyritous hematite, silicious siderite with and without pyrite, pure pyrite, cherts free from all iron. No regularity of sequence has yet been noted if any exists. Descriptions of the Ontario iron ranges by Coleman, Miller, Bell and the author in various reports of the Bureau of Mines all agree on this close association. Van Hise[7] regards the pyrite as a chemical sediment and in part the source of the iron ore bodies. He writes:—

"In the Michipicoten district of Ontario, pyrite and marcasite occur rather plentifully within the original iron-bearing carbonates, and also very abundantly with quartz in associated rocks. Pyritic quartz rocks also occur in the Vermilion district in subordinate quantity. The iron sulphide to some extent has undoubtedly been a source of the ores. But however one may emphasize the importance of ferrous silicate and iron sulphide as a source of the ore bodies, it still remains true that the iron-bearing carbonates are the dominant original sedimentary rocks out of which the iron-bearing formations and ore bodies have been produced."

The rocks of the Helen iron formation have been more carefully studied than those of the corresponding formations in other parts of the Province. As all are closely similar, the description of the Helen series may be taken as applying to all. I quote from Dr. Bell[8] rather than from the earlier reports by Coleman and myself.

"The Helen formation consists of a series of allied and related rocks named in order of their importance in the region as follows:—Banded chert, massive granular chert, sideritic chert, pyritous chert, banded jasper, rusty quartzite, gruneritic and other amphibolitic schists, cherty siderite, and iron ores—hematite, magnetite, pyrites and even pyrrohtite. Between these rocks there is every phase of gradation. Besides these ferruginous rocks the formation includes a number of argillaceous rocks, phyllites, and biotitic and epidotic schists—all undoubtedly sedimentary—which are found not only interstratified with the ferruginous rocks, but also both above and below them, although always in intimate connection with them.

"The sideritic chert consists essentially of two minerals—quartz and siderite, with which are almost always associated chlorite, sericite, pyrite, oxidation products of pyrite and carbonate, and sometimes microcline and other feldspars. Examined microscopically, some of the quartz is seen to be clastic, but most of it is chemically precipitated, often in the form of chalcedony. Both microcline and chlorite, the former in rounded grains and the latter in plates with frayed edges, are fragmental, and their areas have been greatly reduced by the invading carbonate. Pyrite is frequently an inclusion in both the chlorite and carbonate, and it occasionally developes in secondary veinlets in association with chlorite, carbonate and quartz. Some of the sideritic cherts contain so much chlorite that they pass into cherty sideritic phyllites, or so much microcline that they become sideritic arkoses.

"The massive grayish, pinkish or whitish chert, when quite pure and undecomposed, is holocrystalline, and beneath the miscroscope is seen to consist of an interlocking mosaic of quartz. This is the 'sandstone chert' of the Michipicoten prospector. It is often markedly rusty, due to the oxidation of iron carbonate, and less frequently iron pyrites, both of which are nearly always present. With an increase of one or other of these minerals, the rock passes into a sideritic chert or pyritous chert."

These iron-bearing rocks are mainly chemical sediments, though some mechanical sediments are included. The adjoining rocks at Michipicoten are quartz porphyry schists supposed to have originated as volcanic tuffs. These, no doubt, fell as ashes on both land and water, in the latter case being rudely stratified. At intervals the volcanic activity naturally diminished and chemical precipitates formed a relatively larger portion of the sediments. Solutions of lime, iron, silica, and sulphur were carried to the water there to be precipitated. The recurrence of volcanic activity would overwhelm the chemical sediments in the mechanical ones. In this way the small lenses of siderite and silica in the tuffs adjoining the iron formation proper can be accounted for. Then came a long period of volcanic inactivity

when chemical sidementation again predominated. Silica and cherty siderite and pyritous chert were precipitated until beds several hundred feet thick were formed.

How the silica, iron and sulphur were dissolved and precipitated is not absolutely clear. Presumably the iron was partly transported as a carbonate and partly as a sulphate. Winchell[9], Clements[10], and Bell[11] have speculated on this point. How was the silica dissolved and how precipitated? The intimate mixture in the cherty siderite suggests that both the iron carbonate and the silica were precipitated together. The iron sulphide was doubtless reduced from the sulphate through the action of carbon. Considerable is still found in the shales adjoining the iron formation. Pyrite and silica were, however, precipitated together as shown by their intimate mixtures.

The pyrites in the iron ranges can be satisfactorily accounted for as a chemical precipitate. Can it be otherwise accounted for? The only alternative would be as a precipitate in porous beds introduced after their folding. One notes, however, that all the beds are not equally porous, and yet the pyrites is found in compact siderite, in very porous chert, in loose hematite and in hard, compact almost flinty quartz. Where the beds are brecciated one would expect to find abundant pyrites, and there is often none, as at Sayer's Lake. Soluble rocks like the siderite should contain pyrites in larger amounts than the compact flinty cherts, but the reverse is the case.

In Temagami, Professor Miller[12] finds two parallel iron ranges several miles apart, and separated by an intrusive greenstone mass. They dip in opposite directions, as the legs of an anticline. Overlying and parallel with them are two belts of pyrites. The occurrence can be explained as a bed of iron and silica covered by one of pyritous silica, the two folded into an anticline and the summit eroded. Or if the pyrite is not a bed, then one must suppose that solutions came up several miles apart, and impregnated beds parallel to the two iron beds. Obviously the former is the more likely.

We conclude, then, that for a number of our Ontario pyrite bodies the origin has been one of chemical sedimentation. For Strawhat, Lake Kaministiquia, Helen, and the Michipicoten range, Goudreau Lake, and the Temagami ranges this seems proven. For the Hastings occurrences there is not so good proof, though nothing is known pointing more strongly to another origin. The similarity of the Virginia deposits in Louisa County to those of Hastings appeal to me strongly. Possibly they may be replacement deposits, as suggested by Nason[13], but the writer has seen nothing about them unexplainable as a sediment.

URANIUM.

The current idea that uranium ores derive their value from their content of radium is probably due to the fabulous value ascribed to radium in many publications —a value based, perhaps, upon prices paid for it as a chemical and physical curiosity, since they are not justified by any uses thus far found for it.

The principal known deposits of uranium ores in this country are in Colorado, where carnotite and uraninite (or pitch blende) furnish the product. A reduction plant near Cedar, in San Miguel County, is operating on carnotite ores running 2 per cent. or less of uranium and having also a vanadium content. Deposits of carnotite near Meeker, in Rio Blanco County, discovered in 1906, were described by Hoyt S. Gale, of the United States Geological Survey, in Bulletin No. 315. The uraninite, or pitch blende, is mined in the Kirk, Wood, and German mines, in Gilpin County, Colorado. Small quantities of uranium have been found in the Black Hills as uranium phosphate (autunite). Other small deposits, of mineralogic interest only, have been found in Connecticut, North Carolina, Texas and California.

So far but few uses have been found for uranium ores. Experiments made with the metal as a steel-hardening material do not show that any particularly valuable qualities are added to the steel that are not given by the use of other elements that are at present cheaper. Uranium in the form of an acetate is used as an indicator in various determinations in organic chemistry, and other salts are used in iridescent glass and pottery glazes.

The occurrences and uses of uranium ores are described by Frank L. Hess, geologist, in an advance chapter from "Mineral Resources of the United States, Calendar Year 1906," just issued by the United States Geological Survey.

COAL BRIQUETTING IN CANADA.

The largest and most successful coal briquetting plant in America is built on Canadian soil. It is situated at Bankhead, Alberta.

The plant is the property of the Bankhead Mines, Limited, and has been running since March, 1907, producing 300 tons of briquettes in 24 hours. An additional unit is being installed, which will be completed and running about February 1st, 1908. This will increase the output to 500 or 600 tons per day. The process used is that of the Zwoyer Fuel Company, which briquettes the dust from the anthracite operations of the Bankhead Mines. Coal tar pitch having a melting point of 140 degrees F. is used as a binder. The resulting briquettes are a hard, clean fuel, which is used on the locomotives of the mountain division of the C. P. R. and by the domestic trade. Excellent results are obtained wherever the briquettes are used.

Notwithstanding the very high cost of binder, due to the long transportation and the high wages paid in this section of the country, these briquettes are made and sold at a profit.

BOOK REVIEWS

A MANUAL OF FIRE ASSAYING. CHARLES H. FULTON, PRESIDENT OF THE SOUTH DAKOTA SCHOOL OF MINES. XII. X, 178 PAGES, 6 BY 9 INCHES. ILLUSTRATED; $5.00 POST-PAID. HILL PUBLISHING COMPANY.

Upon the subject of fire assaying many good books have been written. In few of these books, however, have the authors freed themselves from a tendency towards empiricism. Indeed much of the literature of fire assaying is on a level with the cook-book standard.

Mr. Fulton has broken a path for himself. The book is broad in scope, practical in treatment, well illustrated, clearly printed and of encouragingly modest bulk.

In the first chapter, "Assay Furnaces and Tools," coke, gasolene and wood-burning muffles are illustrated. Longitudinal and cross sections of the brick-built furnaces are included. The cost of operation is estimated for each kind. This is a useful departure. The ingenious Keller multiple scorifier tongs are shown on page 14 and the Keller cupel charging device on page 15. By means of the former, lots of twenty-five scorifiers may be handled at one time. The latter device will charge 20 cupels with lead buttons simultaneously.

Chapter VI. is valuable. It treats of assay slags lucidly and simply. Chapter VII., on "Cupellation," contains information of the utmost importance to the assayer. For instance, the influence of impurities upon the cupellation of gold and silver is tabulated. Beginning with tin, which induces a loss of 2.0 per cent. gold and 13.9 per cent. silver and ending with tellurium, whose corresponding figures are 55.8 per cent. and 67.9 per cent., each of the most usual metallic elements is mentioned.

Space will not permit us to enumerate the many practical hints brought out by Mr. Fulton. Undoubtedly the material for this volume has been carefully selected. Moreover, it has been put into excellent shape.

The two concluding chapters upon "The Assay of Ores and Alloys Containing Platinum, Iridium, Gold, Silver, etc.," and "The Assay of Tin, Mercury, Lead, Bismuth and Antimony," round out the book very satisfactorily.

A pleasant evidence of modernity is the absence of antiquated wood cuts. The apparatus mentioned and represented is strictly up-to-date. No doubt this is a consequence of Western environment.

EXCHANGES.

The Toronto correspondent of the *Mining and Scientific Press*, October 19th, has a word of commendation for THE CANADIAN MINING JOURNAL. We are thankful for this. We are fighting for decency and honesty. Our Californian contemporary has removed the fur from many financial felines. Its approval is worth having.

"A Modern Illinois Coal Plant" is described in the October *Mines and Minerals*. The powder magazine of Saline County Coal Company is described as built of brick, clay, and concrete foundations. It has a tile coping, composition roofing, steel-faced door and tamped dirt floor. It has a capacity of two car loads of black powder. No dynamite is stored.

The *Mining World*, October 19th, contains the first of a series of articles on "The Asbestos Industry of Quebec," from the pen of the *World's* indefatigable travelling correspondent, Mr. Ralph Stokes. "The mines," writes Mr. Stokes, "are now in an enviable position of independence, with a market of assured strength and no prospects of menacing outside competition."

The *Engineering and Mining Journal*, September 28th, opens with the second of a series of articles by W. R. Ingalls on "Lead and Copper Smelting at Salt Lake." The incidental defects of the large Garfield copper smelter of the American Smelting & Refining Company are due, according to the writer of this article, to the fact that the company has too many engineers and does not trust its work entirely to a single competent man.

The South African Mines, Commerce and Industries, August 3rd, takes up the question of ventilation in the deep mines of the Rand. The prevalence of miners' phthisis is attributable to the "minute and deadly fragments which Main Reef ore powders into when bored by machine drills." The miners themselves are responsible for much of this. The men retain their prejudice against the use of respirators and sprays.

The Mining Reporter, September 12th, remarks upon the new mine tax law of the State of Arizona: "Under the new mine tax law, which has occasioned but little dissatisfaction, the larger concerns . . . are assessed higher and are withal bearing a more just share of the territorial government expenses." None of these larger companies, indeed, made any complaint. But a loud outcry was heard over the valuation of none-producing claims, fixed at $20 per acre.

"The Montreal River Silver District" is the subject of a well-illustrated article in *The Engineering and Mining Journal*, September 21st, by Reginald Meeks. "If the curses of 'wild-catting' and over-capitalization do not choke the legitimate enterprises, the district, as a whole, will undoubtedly prosper. But even at this early date there are rumors of companies being organized with capitals ranging from $1,000,000 to $5,000,000, without the least thought concerning the obligation these capitals mean."

In the *Journal of the Franklin Institute*, September, an article on "The Schuyler Mine" is concluded. A convenient method of determining ash is graphite is also described on another page. Combustion is effected by means of a stream of oxygen from an "oxone" generator. Oxygen made from chlorate of potash and manganese dioxide will also serve the purpose. About one-third gram of graphite is taken for analysis and mixed with about twenty milligrams of fine, carefully ignited magnesia. The stream of oxygen is delivered to the crucible by means of a clay pipe stem.

Writing of the gold measures of Tangier, Nova Scotia, in the *Mining and Scientific Press*, October 5th, Mr. George A. Packard mentions the quartz veins of the district thus: "The sedimentaries consist of slate and more or less metamorphosed sandstone, locally termed 'whin.' The veins occur in the slate, often near or at the contact with the whin. As far as I have had an opportunity to observe them, these slate 'belts' are not over seven feet wide. The quartz veins vary from a fraction of an inch to eight feet in width. They are made up of white quartz, with up to 2 per cent. of sulphides, and a varying, though considerable, quantity of included slate derived from the walls. The sulphides are pyrite, pyrrhotite, chalcopyrite, arsenopyrite and galena. The district differs from some others in Nova Scotia in that here the proportion of arsenical sulphides is very small."

The *Engineering and Mining Journal*, October 12th, opens with an article on the Mansfield copper mines in Germany. At these mines a new row of deep-level shafts

is being sunk. They are circular and of 6 m. diameter. Hoisting is done on double-deck cages, four trucks being raised at a time. Most of the shafts are equipped with cross-compound, conical-drum steam winding engines. The ventilation of the mines is secured chiefly by natural means, supplemented by Rateau fans at the surface at some of the shafts. The underground haulage is done by horses. Heap roasting of the ore brings the copper content to 3 per cent.

PERSONAL AND GENERAL

Mr. J. Groves has been appointed manager of the Brown Alaska Company's Nobles mine.

Mr. Norman McKenzie has been appointed superintendent of mines at Dominion No. 2 Colliery.

Dr. Frank D. Adams, Logan Professor of Geology at McGill University, arrived in Montreal from England on October 15th.

The head office of the Foster Mining Company has been removed from the Traders Bank Building to Room 74 Home Life Building.

Mr. J. H. Plummer, president of the Dominion Iron & Steel Company, sailed for England on the Empress of Britain on October the 18th.

Mr. Harris, formerly superintendent of the Hall Mines smelter, is now filling a similar position under Mr. T. Kiddie at Hadley, Prince of Wales Island.

Mr. John McMartin and Mr. H. Timmins, of La Rose Syndicate, are in England. They are reported to be negotiating the sale of two of their mines.

Mr. H. J. Fuller, president of the Canadian Fairbanks Company, Limited, sailed on the 18th of October for England on a six weeks' visit.

Mr. A. F. C. Ross, auditor of the Canadian Mining Institute, has been elected president of the Dominion Association of Chartered Accountants.

Canadian correspondents are informed that Mr. J. D. Kendall, consulting mining engineer, has removed to Friars House, New Broad St. London, E. C.

Mr. J. Macaulay, who until recently was in charge of the La Plata mine at Nelson, has left for the east, the property being operated under the direction of Capt. T. H. Thethewey.

Among the visitors to Montreal this week were Mr. Alexander Dick, of the Dominion Coal Company, and Mr. H. E. Rice, superintendent of the Dominion Iron & Steel Company's rod mill, at Sydney, C.B.

Mr. J. F. Robertson, who since May last has acted as assistant to Mr. F. Keffer, engineer of the British Columbia Copper Company, is now on the engineering staff of the Mond Nickel Company at Victoria Mines, Ont.

Among recent visitors to Victoria was Mr. Arthur Hebden, secretary of the Southern Cross Mining & Smelting Company, a British enterprise owning properties on Vancouver Island. It is stated that the company has completed arrangements for the erection of a smelter near the mouth of Alberni canal.

A meeting of the committee appointed at the last annual meeting of the Canadian Mining Institute to prepare and offer certain suggestions to the Ontario Government with a view to securing an amendment of the Act, "Supplementing the Revenues of the Crown," will be held at the King Edward Hotel, Toronto, on October 31st and November 1st.

Dr. J. MacIntosh Bell, Director of the New Zealand Geological Survey, passed through Toronto recently on his way to New York. Before returning to New Zealand Dr. Bell will deliver a series of lectures at Harvard, Yale and Princeton Universities. The past few weeks Dr. Bell spent in visiting Cobalt and other mining districts.

At the Spokane Interstate Fair, which was held early in October, the prize for the best mineral display was awarded to the Kootenay district. This exhibit, which had previously been shown at the Nelson Fair, was arranged and collected by Mr. N. V. Cavanaugh, assisted by Mr. H. E. Wade, to whose efforts much praise is due.

Mr. W. Fleet Robertson, Provincial Mineralogist for British Columbia, reports great activity on the west coast of Vancouver Island and in the mining districts of the Queen Charlotte Islands group, where a number of new and promising copper properties are being opened up. At Rainy Hollow in the Atlin district several properties have been bonded to the representatives of British capital.

Mr. F. B. Vrooman, president of the British-American Dredging Company, operating in the Atlin district, B.C., has returned to London after spending some time inspecting the company's property on the Hootalinqua River. Mr. Vrooman stated in an interview that the company expected to have three dredges in operation next season, and that he had a high opinion of the gold dredging potentialities of this section.

Dr. W. G. Miller, Provincial Geologist; Mr. T. W. Gibson, Deputy Minister of Mines, and Mr. E. T. Corkill, Inspector of Mines, have returned from Deloro, in Hastings County, where they inspected the new smelting plant, now almost completed, of the Deloro Mining & Reduction Company. With this and other smelters now working, or nearing completion in the north country, the camp will soon be free from the American smelters.

Mr. E. T. Corkill, Inspector of Mines for the Province of Ontario, reported recently upon his return from a visit of inspection in Western sections of the Province that the Port Arthur blast furnaces, which have been in operation since June last, are now treating 150 tons of magnetite from Atikokan daily, while shipments will ere long be commenced from the Northern Pyrites Company's mine, north of Dinorwic. Mr. Corkill also states that prospecting for gold is active in the Sturgeon Lake district.

Mr. Frank G. Stevens, erstwhile in charge of properties in British Columbia and well known to many of our readers, has been for some time past general manager of the El Favor mine in Mexico. In a recent report to the directors of the company, Mr. Stevens states that operations have resulted in the development of positive ore reserves to the value of $7,439,440, while probable ore is valued at $8,841,740. Development work at the property last year yielded a result of opening up ore bodies to the gross value of $3,978,000.

The judges, Messrs. Hobart and Going, have recommended the Council of the Canadian Mining Institute to award prizes as follows to student members who presented papers at the last annual meeting of the Institute, namely: President's gold medal and prize of $25 to Mr. Frank E. Lathe, of McGill University, for his paper on "Basic Open Hearth Steel Manufacture as Carried Out by the Dominion Iron & Steel Company at Sydney, Cape Breton';; and prizes of $25 each to Messrs. W. J. Dick, of McGill University, and Mr. G. R. McLaren, of the School of Mining, Kingston, for their papers entitled respectively "The Caribou Consolidated Hydraulic Plant,

Bullion, B.C.," and "Underground Mining Methods at the Quincy Copper Mine, Michigan." Papers by Mr. C. V. Brennan and Mr. G. D. Drummond, both of McGill University, were also highly commended.

Mr. C. R. Devlin, representing Nicolet in the Federal House of Commons, has been invited by the Hon. Mr. Gouin, Premier of Quebec, to accept the portfolio of Mines, Colonization and Fisheries in his Government, in succession to Mr. Jean Prevost, who resigned recently. Mr. Devlin has been actively associated for some years past with public affairs, having been elected to Parliament first in 1906, later acting as Dominion immigration agent in Ireland, from which position he resigne to represent Galway in the Imperial House.

Mr. Geo. R. Naden, M.P.P., representing Greenwood in the British Columbia Legislature, has returned after spending the summer in the Telkwa district. Referring to the mining possibilities of this new field, Mr. Naden states that surface indications are most promising, and in the Bulkley valley, on the Babine range and elsewhere are large deposits of ore rivalling in size those of the Boundary district, while carrying higher values. Already much surface prospecting has been attempted, one company having expended over $50,000 this summer in work of that character; but actual and important progress is, of course, dependent on the completion of the railway.

Mr. J. B. Tyrrell has opened an office at 9 Toronto street, Toronto, Ont., where he will henceforward be open for engagement as consulting mining engineer. Mr. Tyrrell is a mining engineer of ripe experience, a professional man of the highest type. Our readers will remember recent articles of his written expressly for the JOURNAL. In one of these Mr. Tyrrell wrote of the evaluation of mining property, and it is in this department of mining and in practical economic geology and the examination of mineral deposits that Mr. Tyrrell has made his name. However, it need hardly be added that Mr. Tyrrell is well qualified in all the branches of his profession. Mr. Tyrrell graduated from Toronto University in 1880, since when he has been continuously engaged in geological and mining work.

At a meeting of the Council of the Canadian Mining Institute, on Saturday, October 5th, Mr. George R. Smith, the past president, and manager of Bell's Asbestos Company, was presented with a handsome silver tea service, purchased from a fund started on the occasion of the Institute's excursion to Cobalt in March last, and to which a number of members subscribed. Accompanying the gift was an address, appreciative of Mr. Smith's services to the Institute, and a list of subscribers. The presentation was made by the secretary. Several of the gentlemen present, including Dr. J. B. Porter (in the chair), Mr. Dresser, Mr. Hopper and Mr. Stevenson Brown also spoke in testimony of Mr. Smith's unfailing zeal in promoting the welfare of the Institute, not only during his term of office but since the incorporation of the Society, of which he was a charter member. In reply Mr. Smith said that while thanking the subscribers for this kind expression of good-will, he felt that the Institute had already honored him above his deserts in having elected him to the office of president for two successive years. This, he felt, was the highest honor and the greatest compliment the Institute could bestow to any member and nothing he had done nor could do in the future to help forward the work of the Institute would, in his estimation, offset the debt he owed the Institute for the honor they had done him in electing him to that office. The Institute, Mr. Smith added, had grown to be regarded as one of the most influential and important of our national institutions and one that was materially assisting in the development of the resources of the country. To be associated with such work was a privilege; to every mining man who had the interests of our Canadian industry at heart it should also be a duty.

Queen's University has conferred upon Mr. A. P. Low, Deputy Minister and Director of the Dominion Geological Survey, the honorary degree of LL.D. No person familiar with Mr. Low's brilliant work can doubt that he is one of the foremost living field geologists and explorers. His unique work in the sub-Arctics has marked him as a signally efficient explorer. As an administrator, although he has not recently enjoyed the best of health, Dr. Low has demonstrated that he has lost none of his virility and keen-sightedness.

CORRESPONDENCE.

To the Editor, CANADIAN MINING JOURNAL.

Dear Sir,—I have read your suggestions in regard to the Canadian Mining Institute in your issues of July 15th and August 1st, and also the letters in answer, which you have published since, from several members of the Institute. Permit me to congratulate you on the stand you have taken.

The questions raised by you, as you say in your issue of August 15th, are: Can the Institute be made more useful? Does the Institute, as a corporate entity, take as active a part in the mining affairs of the country as many of its members desire it should? If not, what are the remedies? All matters of personal feeling should not be allowed to effect these important questions in the slightest.

These questions, Mr. Editor, as a good many members of the Institute will remember, were raised by me at the meeting in Montreal in March, 1905, in my presidential address, in which I said, in part:—

"Could we not, all of us of the Canadian Mining Institute, the only incorporated Institute representing the mining men of the whole country, do more than we are doing to hasten a more rapid and healthy development and progress of this immense mineral wealth of Canada? I have no hesitation in saying yes, we can do much more and it is our duty to do it . . . We (the Institute) have done a great deal in the past, but we can do, and must do more in the future . . . In my opinion the time has come for the members of the Canadian Mining Institute to adopt such changes in the constitution and by-laws of the Institute as will conduce to these results."

These changes, I briefly stated in the same address to be, in my opinion:—

"(a) A larger representation of the members on the Board or Council of the Institute.

"(b) The formation of strong branches of the Institute in the different Provinces and in some of the important mining districts of the coutnry."

In support of these suggestions I went on in this address to show that, in the past, only a few members have been active in Canadian Mining Institute affairs, and that in future we should re-arrange matters in order

that a good many more members from all over the country would in some way join these few, and I added:—

"It will readily be seen that the above proposed changes or additions to our by-laws will accomplish this, not only by enabling more of us to meet in Council in Montreal, Toronto, and other places in the central parts of the country as often as necessary, but also by means of branches we shall be in constant communication and interchange of ideas with members residing in the outlying districts. These, in the meetings of their branches, which can be held several times a year if necessary, will bring up and discuss all the interesting subjects connected in any way with their local mining interests and industries, and their chairmen, secretaries and full organizations will always be in touch with the central organization. Thereby the necessary activity and life will run through the Canadian Mining Institute from the Yukon to Cape Breton, together with the necessary spirit of mutual help and unanimity of purpose, so essential to permanent achievements."

Then, at the end of the address, I gave at length the example of the Canadian Manufacturers' Association, which, as everyone knows, has been and is a most successful and powerful association, and which was and is conducted on the lines suggested, viz., a large executive board or council of 100 representatives from all parts of Canada, elected at the annual meetings on the per capita basis of one for every fifteen members, and with local branches organized in leading Canadian centres with authority, under the constitution and by-laws, to deal finally with any local question, while representations with regard to general questions are dealt with merely by recommendations which are forwarded to the Executive Council for final decision.

I was glad to see, Mr. Editor, that your influential paper, the official organ of the Canadian Mining Institute, is again attracting the attention of the members to these most important points to the mining community of this country, and that, to judge by the letters you have published (if we except the one of the Secretary, which would have been better left unwritten), prominent members of the Institute concur in your views.

Let the good work go on and let us have a broader, more lively and more powerful Canadian Mining Institute. In these days of rapid extension of our mining and metallurgical industries a greater Canadian Mining Institute will be most useful, and recent events have shown that it is also a necessity, in order that we may properly fulfil these portions of our mission as laid down in the charter of the Institute, viz.:—

"To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada. To encourage and promote these industries by all lawful and honorable means."

Yours sincerely,

EUGENE COSTE.

SPECIAL CORRESPONDENCE

ALBERTA.

EDMONTON.—This month sees at Edmonton quite a revival in the coal trade. Numerous small mines which have been closed down for the summer months are now opening up. The methods of mining are very primitive, the majority of the mines being opened along the outcrops of the vorious seams. The typical mine consists of two tunnels driven level course in the coal from the bank of the Saskatchewan River. From on of these tunnels a small shaft is raised to act as an air shaft. Natural ventilation is employed to produce the small current of air necessary to keep the mine free from smoke. The mine timber is cut on the banks of the river in the vicinity of the mine, and as the roof is generally good very little timber is required. The Saskatchewan River is deep enough to allow the passage of shallow draught steamers, and these steamers are employed to tug the coal barges from the mines into Edmonton.

The method of screening the coal is very crude. A tipple of poplar poles is erected from the mine mouth to the edge of the river, and a chute constructed from the end of the tipple so that the coal when dumped from the mine cars runs by gravity over a short bar screen and into the waiting barge underneath.

In winter when the river freezes over sleighs take the place of barges, and haul the coal on the ice right into the heart of the city.

The seams being mined vary from 5 to 8 feet in thickness, and are high grade lignites. The coal makes a splendid domestic fuel and has also been used on locomotives with a fair measure of success.

Ten to fifteen men are employed in each mine, and the output rarely exceeds 50 tons per day.

Last winter it was estimated that 750 tons per day was being hauled from the various small mines.

Most of this was consumed in Edmonton, but a considerable quantity was also shipped to points east along the Canadian Northern Railway as far as Saskatoon.

The price realized for this coal is $4 per ton f.o.b. cars Edmonton. This is a very high price, but owing to the small primitive plants in use and the long haul into town and the necessary unloading from barges to wagons and from wagons to railway cars, the profit to the mine operator is not so large as it otherwise would be.

There is a splendid opening for a few large mining campanies to step in, sink shafts and erect modern plants alongside one of the three railways with which the Edmonton district is supplied.

BRITISH COLUMBIA.

THE KOOTENAYS.—The general situation here is very critical, as far as the metaliferous mines and the smelters are concerned. The prices of copper, especially, and of silver and lead have dropped to an extent that makes it a difficult matter to mine and ship our ores, contending, as we have to, with an extraordinarily high price for mine supplies and labor. Were it not for the very low charges that are in vogue here to-day for smelting and transportation, all of the copper mines, at least, would be closed down tight, and that would mean a shut-down of the smelters. As it is the mines and smelter of the Dominion Copper Company at Boundary Falls have just closed down. While these people were mining a low grade of copper ore their mining and smelting charges only ran somewhere around two dollars, or slightly under, per ton. While the very low price of copper was probably the chief reason for their cessation of operation, it is reasonable to suppose that other factors of the present general state of affairs had a hand in it. The stress here increases hourly, and we would not be a bit surprised to see other Boundary mines close down for a time, if conditions as they are at present continue to prevail. The Boundary ores are principally copper ores, while those shipped from Rossland are what are known as gold-copper ores, so it is expected that if any of the low grade properties can breast

the tide of hard times for a period it will be the Rossland mines, and the case is critical with them too.

The Consolidated Mines at Rossland are shipping about 3,500 tons of gold-copper ore per week, and have been doing active development work on the claims recently acquired. Some valuable ore has been located on the Idaho claim, adjoining the Centre Star, but this was not an unexpected development by any means, as the surface showing on the Idaho is an exceptional one for this district and the claim has shown up well wherever development work has been done on it.

Le Roi mine is shipping approximately 2,500 tons of ore per week to the smelter at Northport. Considerable development is being done, and they are still operating the diamond drill on the Spitzee Group, which they have under bond. Mr. Larson, superintendent, has returned from his holidays, and denies that there is any truth in the rumor that he may leave the LeRoi Company.

At the White Bear they have laid off a few of their small force. It was rumored that they had closed down, but Superintendent Demuth states that they will continue to operate for a while yet.

The everyday development is being pushed on the Giant-California properties and the Jumbo. These properties have some very good ore, of an altogether different nature from the Consolidated and Le Roi properties, and it is hoped that they will locate good bodies of it.

The supply of coke and other fuel is a little more plentiful now and the smelters are running along without any trouble.

The big saw mills of the district are nearly all closing down for the winter.

The coal mines along the Crow's Nest seem to be very busy. There is a great demand for their product, and it is stated that they will not be able to produce too much to supply the various demands this fall and winter.

On the property of the Alberta Coal & Coke Company near Lundbreck, Alberta, the cross-cut which they have been driving to cut five seams of coal has finally pierced these seams. The coal is said to be of a good hard quality, and the total width is about 75 feet. The output of the company is rather small at present, and is being supplied to local consumers. This company controls nearly 6,000 acres of coal land. They are employing about 30 men. There are some very rich zinc properties on Arrow Lake, which would be working now if the owners and American capital could get together. The owner of the principal property, a Northport man, has been offered $100,000 for his prospect, but is holding out for $400,000. The ledge is 400 feet wide, 300 feet of which will run 18 per cent. and 48 feet will average 40 per cent. zinc.

Work on the V. V. & E. Railway is being pushed westward, and a contract has been let for the blasting of a practically solid roadbed out of a perpendicular mountainside near Hedley. This will be quite an expensive and stuepndous piece of work.

Mr. W. Y. Williams, consulting engineer for the Granby Company, has just paid a visit to the Independence proposition on Bear Creek, in the Similkameen District, which the Granby people have under bond. It is stated that the company will keep a force of seven or eight men at work drifting on the ore body all winter.

The Similkameen is the coming mining district here. As soon as the railways are able to handle freight in that district we will begin to hear something of the rich mines they have there. The propositions now being opened up are mostly copper, but some of them are very rich in gold, for instance the mine near Hedley of the Daly Reduction Company, which runs very high in gold values. The placers of this district have not played out yet by any means, either. Most of the placer mining, however, is done now by Chinamen, the white prospectors busying themselves with the big lode mines. A Chinese miner on Old Granite Creek the other day picked up a $57 gold nugget. It is stated that frequent finds are made by these yellow miners of fair sized nuggets.

A very good coking coal is also found in the Similkameen district, and no doubt in the near future we can look to that section for a part of the coke and fuel supply of the Province.

GENERAL MINING NEWS

NOVA SCOTIA.

Glace Bay.—Since December 31st, 1893, the Dominion Coal Company has mined and sold 25,500,000 tons of coal. The labor for the mining the this coal has cost the company $22,000,000. It pays the Province of Nova Scotia a royalty of 12 1-2 per cent., as against 10 per cent. paid by all other coal mining companies. The total royalties thus paid out since 1893 amount to $3,154,500. It employs 5,000 men, as against 1,800 in 1893. It pays annually $2,996,400, as against $707,400 in 1893.

Westville.—On October 12th, in the Drummond coal mine, John P. McDonald, a miner, was struck by a loaded box and instantly killed.

Port Morien.—The North Atlantic Colliery Company shipped its first cargo of coal on October 17th. One hundred tons of fresh mined coal was sent by schooner to Newfoundland. A three-masted schooner is now loading 600 tons for Quebec. The daily output now is 150 tons. This will shortly be increased to 200 tons. One Ingersoll undercutting machine is used. Air is supplied by a Norwalk compressor of capacity of 30,000 cubic feet of air per minute. The pumps are run by compressed air. Deeps, levels and rooms are being thoroughly cleaned and retimbered. A new Babcock and Wilcox boiler is being installed and the old boilers arebeing cleaned and rebuilt. The water supply is to be taken from Sand Lake. The new smoke stack, 100 feet in height, has been placed in position. The new haulage rope is 14,000 feet long.

Springhill.—Negotiations have again fallen through, owing partly to the fact that Manager Cowans has refused to confer with the men and partly to the unwillingness of the men to abide by the findings of the Board of Arbitration. The officials of the company have been doing duty at the engines and pumps. The Pioneer Lodge, to which the workmen belong, is preparing for a long struggle.

ONTARIO.

Wabigoon.—The action brought by Harold A. Wiley against Anthony Blum for a $150,000 claim on the sale of the Laurentian mine, was dismissed without costs.

Port Arthur.—The West End and Beaver silver mines, the former of which has been producing for some time, are both looking well. At the latter one hundred and fifty sacks of high grade ore have been sacked from the old workings.

The shaft of the Wright zinc mine, north of Pearl River, is down 219 feet. The vein has been traced for 500 feet. It is 5 feet wide. Machinery is soon to be installed.

The Mining Recorder at Port Arthur reports that in the past six weeks 218 mining licenses were issued from his offices. For the current year a total of 298 have been issued. In the large number of mining claims filed the majority recently have been on discoveries of iron ore. Among these the large deposit of hematite at Long Lake is the most prominent. In Conmee Town-

ship deposits have recently been located. Gold claims have been filed at Sturgeon Lake and English River. The Tip Top copper region, soon to be opened up by a Government road, will become a substantial shipper. The East and West End Silver Mountain and the Beaver mines are in operation.

SAULT STE. MARIE.—A prospector named Michael has returned from Michipicoten Island with fine specimens of native copper and silver. If further prospecting gives satisfactory results a company with a small but sufficient capital will be organized.

COBALT.—The Arigiod mine has laid off all its employees except Superintendent Hoskin. It is rumored that the property is to be sold to the Jacobs.

On the 50 foot level of the Trethewey a six inch vein of native silver has been cut.

A royalty of $51,992 has been paid by the O'Brien Mining Company to the Ontario Government, being the amount due up to September 30th. Under the agreement the Government received 25 per cent. of the value of the ore mined, after certain handling charges have been deducted. The total amount of the royalties which this mine has contributed to the Provincial exchequer since December last is $222,745.

Seventy men are now employed by the Cobalt Lake Mining Company, as compared with forty-nine in July. Eight drills are running night and day.

The projected Kerr Lake branch of the T. & N. O. will probably be completed early in the coming year.

The main shaft of the Ruby Silver Mine has reached the 53 foot level. Drifting has been started on two veins.

The main shaft of the Green-Meehan is sunk to 114 feet. Drifting has been done at the 100 foot level. Two machines are being run double shift.

The Cobalt Concentrators have secured the contract from the Foster Cobalt Mining Company, Limited, to build a concentrator. The plant will be similar in process to that which is being erected on the Nipissing. The details of its capacity and site have yet to be arranged.

The Erie mine has suspended operations and the sale of the property is rumored.

The Coniagas Mines, Limited, in its appeal against income assessments levied by the Town of Cobalt, argues that, as it paid $4,000,000 for the mine, no income could be taxed until capital expenditure had been erturned by the product of the mine.

BRITISH COLUMBIA.

BOUNDARY.—In the past year the Great Northern and the C. P. R. have spent more than $100,000 in and around Phoenix camp in providing new spur lines, etc., for the large ore shippers. The new Rawhide spur cost about $20,000, and the Great Northern's spur to the Granby mines cost $100,000.

Contrary to newspaper reports, the White Bear mine has not been closed down. The report was due apparently to the laying off of six men.

Within the past year the higher price of coke, labor and cost of living generally has brought up the cost of producing copper very materially. Companies formerly producing copper at a cost of from 9 to 10 cents per pound cannot now bring their costs below 11 and 12 cents. When future developments of the coal fields of Alberta and British Columbia bring the price of coke down and make the supply more regular, the cost of copper producing will decrease. This is probably the only factor besides larger and more efficient plants that will tend to lower costs.

SIDNEY INLET.—The Indian Chief group of mines, belonging to the Vancouver Island Copper Company, has a promising bornite showing. The mine is being equipped with a 4,00 foot tram with a daily capacity of 500 tons. The tram goes directly down to the shore.

VANCOUVER.—W. D. Mathews, president of the Conosolidated Mining & Smelting Company of Canada, gave an interview on the condition of the Province. He stated that British Columbia, more than any other part of the Dominion, should be interested in having labor conditions which would enable capitalists to meet on equal terms on that line other section having the same natural resources; yet the conditions were exactly the opposite from those that should prevail. In the face of this fact there had been a depression in business along lines in which the Province was interested, making matters increasingly difficult. Silver had recently dropped 7 cents per ounce, lead had gone down $15 per ton, and copper was 12 cents below former quotations. The lumber business was also uncertain. Taking all these facts into account, there must shortly be a deadjustment of wages to meet the changed conditions, and the sooner this necessity was realized and accepted by all classes the better it would be for the future of the Province.

GRANBY.—The annual report of the Granby Consolidated Mining & Smelting Company includes the following financial statement:—

Assets—Cost of land, real estate, machinery, buildings, dwelling and equippment, $15,180,913.81; stocks, bonds and bills receivable, $895,674.69; fuel and store supplies, $130,536.88; cash and copper, $853,280.70. Total, $17,060,406.08.

Liabilities—Capital stock, $15,000,000; in the treasury, $1,500,000; issued stock, $13,13,500,000.00; dividends collected on liquidator shares, $883.67; accounts and bills payable, $783,764.76; surplus, $2,775,757.65. Total, $17,060,406.08.

The mine development is reported as 9,700 feet. Instead of the estimated 25,000,000 pounds of copper only 16,403,749 pounds were produced, 3,250,000 pounds less than the previous year. The net profits, however, were higher than previously, but not at all as large as might have been if the coke supply had been regular. The cost per pound of copper produced after deducting the value of gold and silver was 10.14 cents during the last year, as compared with 8.35 cents in the preceding year. The eight furnaces of the smelter are now in shape to handle more than 1,000,000 tons of ore per annum. This should mean a copper production of 30,000,000 pounds per year.

During last winter, when prices were high, the furnaces suffered from snow blockades and in the spring the fuel shortage hit them hard.

The sinking of the new Victoria three compartment shaft and the installation of an electric haulage system on the 400 foot level were among the year's most important new work completed.

Dividends during the year aggregated $1,620,000, represented by four quarterly disbursements of 2 per cent. and an extra dividend of 1 per cent. For the period ending June 30th there was a surplus of $2,775,757.

The company received an average price of 22 cents per pound for its copper. Its metal production included 257,378 ounces of silver and 35,083 ounces of gold.

Last year's directors, consisting of George F. Baker, Jr., George Crawford Clark, George Crawford Clark, Jr., Jay P. Graves, H. L. Higginson, B. Hochschild, Arthur C. James, J. Langeloth, George Martin Luther, William H. Nichols, W. H. Robinson, Sanford H. Steele, Edwin Thorne, A. L. White and Payne Whitney, were re-elected.

The officers elected were are follows:—J. Langeloth, president; Jay P. Graves, vice-president and general manager; George Martin Luther, vice-president; George Crawford Clark, Jr., vice-president, and Northrup Fowler, secretary.

The purchase by the Granby Company of a large interest in the Crow's Nest Pass Coal Company insures an adequate supply of coke for the future.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Commenting on the recent meeting of the Iron and Steel Institute in Vienna, the *Iron and Coal Trades Journal* compares the conditions under which the iron industry is carried on to-day with those existing when the Institute was founded thirty-eight years ago. Then the total make of pig iron throughout the world was less than 12,000,000 tons, while the world's make of steel was not more than 250,000 tons. To-day the world's make of pig iron is over 60,000,000 tons, while the total steel output is probably not less than 45,000,000 tons. Since its inception the Iron and Steel Institute has materially assisted in giving a general impulse to the introduction of new methods, new processes, new appliances, and more economical systems, and through these, our contemporary points out, the expansion reflected in the figures quoted has largely been brought about.

In an address to the National Association of Colliery Managers, the president, Mr. G. H. Winstanley, F.G.S., referring to the institution by the King of a "kind of mining Victoria Cross," said that it was of course the duty of colliery managers to make it very difficult, by increasing the element of safety in mines, for that doceration to be attained. Meanwhile official statistics of mining progress show that very remarkable and gratifying improvement in the general safety of British mines. Fifty years ago the proportion of lives lost annually was one in about every two hundred and fifty employed in and about mines. The average for the last ten years has been about one anually in every seven or eight hundred employed. And whereas from explosions, one life in every thousand employed was the average fifty years ago; the average at the present time is only one in nearly forty thousand.

The make of pig iron in the United Kingdom for the half year ending June 30th, 1907, was 5,194,731 tons, as compared with an output of 4,905,424 tons for the corresponding period of 1906, and with an output of 4,621,600 for the first half of 1905.

AUSTRIA.

Among resolutions passed by the Miners' International Congress, we note the following: That the employment of children under fourteen in the mining industry and of persons under sixteen underground should be prohibited by legal enactment; that female labor in mines should be prohibited; that a pension be paid miners after twenty-five years' work in the mines; that the principle of a minimum rate of wages be generally applied. The representation at the Congress included 58 delegates from Great Britain, 2 from the United States, 17 from Germany, 19 from Austria, 10 from Belgium and 6 from France.

BELGIUM.

The output of pig iron from Belgium blast furnaces during the eight months of the present year is 950,640 tons, or a slight increase over last year's returns for the same period.

FRANCE.

The eight-hour working day in mines is a bill providing for which has passed the popular assembly, has yet to be approved by the French Senate, and there is good reason to believe that the proposal will there meet with considerable opposition.

UNITED STATES.

According to figures compiled by the *Mining World* (Chicago), one hundred and twelve metal mines and works in the United States distributed profits during the nine months of the present year, ending with September, aggregating the considerable total of $71,944,260. Our contemporary affirms that since incorporation these properties have paid $546,885,672 in dividends on an issued capitalization of $604,318,405, or nearly ninety per cent. These returns do not include dividends declared by the Amalgamated Copper, Copper Range Consolidated and other large corporations deriving profits from shares held in mines and metallurgical works.

In September five mines in the Coeur D'Alene district, Idaho, paid dividends aggregating $811,000, making the total distribution of profits for the year $4,559,500. A new and important discovery of galena is reported to have been made on the Vienna-International mine.

The State Geologist of Indiana reports renewed interest in the iron industry of that State. At Gary a number of blast furnaces are being constructed, at which point cheap fuel is obtainable.

The report of the Camp Bird, Limited (Colorado), just issued, shows earnings of £176,681, out of which two interim dividends, each amounting to £102,500, were paid. The net value of the ore reserves is placed at £703,525.

The output of the Montana copper mines has been reduced to 40 per cent. of the normal production, the smaller and independent concerns having also been forced to curtail shipments, the smelters having declined to treat their ore.

The United States Steel Corporation has decided to adopt the Koppers system of coke ovens on a large scale, and several thousands of these ovens, of the latest regenerator construction, are to be built in connection with the large new steel works to be erected at Chicago and elsewhere. The special features of the Kopper oven are: The distribution of the heating combined with easy means for regulation; the accessibility of all parts of the construction for inspection; and the large output of coke, by-products, and surplus combustible gas.

The Corporation has also, despite the less favorable prospects of the market, enlarged the scope of its plant for building a steel plant at Duluth; and instead of a plant comprising one 500 ton blast furnace, the furnace plant will have two furnaces, and the steel plant and finishing mills will be correspondingly larger.

Butte, Mont.—Oliver Crane, Master in Chancery, who heard the testimony of the famous smoke case, wherein it is sought to close the Washoe smelter of the Amalgamated Copper Company, has announced a draft of his findings of fact and set October 25th as the date on which he will hear objections to them and make final settlement. Upon the operation of the settlement depends the running of all the mines with the exception of several Clark properties.

JAMAICA.

The United States Consul at Kingston reports that promising copper areas have been acquired and being worked by American interests near Clarendon.

MEXICO.

Operations at the Greene-Cananea mine have been curtailed in consequence of copper market conditions.

AUSTRALASIA.

The report of the Department of Mines of Victoria for 1906 has recently been issued. The gold output of the State for the year is given as 772,290 ounces, the chief producing fields being: Bendigo, 221,187 crude ounces; Ballarat, 164,065 crude ounces; Beechworth, 134,812 crude ounces; Castlemaine, 99,386 crude ounces; Gippsland, 97,180 crude ounces; and Maryborough, 80,-267 crude ounces. The number of men engaged in the industry were 25,304.

Dividends paid by Western Australia mines during the first seven months of 1907 aggregated £1,031,084. All reports from this State are most satisfactory and an exceptionally good year's results are anticipated.

YUKON TERRITORY.

W ITE HORSE.—Extensive ledges of copper-bearing rock have been discovered this season at the mouth of Williams Creek, between Dawson City and White Horse. A settlement namer Bornite City has sprung up.

SOUTH AFRICA.

According to the official report on the mining industry of Natal in 1906, the output of coal in the year was 1,238,713 tons, or an increase of 109,306 over 1905. The colony possesses 24 productive collieries, employing 6,557 persons. The establishment of iron and steel works in the Vryheid district is arranged for, iron ore deposits of good quality having been discovered to the north-east of Holblane Mountain.

It is estimated that the new tax imposed by the Cape Assembly on diamond and copper companies will yield the Government a revenue of £360,000 per annum.

A deposit of cinnabar, occurring in a zone of sandstones associated with quartz and quartzites, which can be traced for some miles on the strike has been discovered west of Hector's Spruit on the Delogoa Bay line. The ore is said to average from 6 to 7 per cent. and it is proposed to treat it by the Elmore process.

South Rhodesia gold production to the end of July reached 2,335,573 ounces.

STATISTICS AND RETURNS

Following are the ore shipments and smelter receipts in South-eastern British Columbia district for the week ending October 19th and year to date, in tons:—

Shipments—	Week.	Year.
Boundary	33,989	1,017,802
Rossland	6,938	218,570
East of Columbia River	5,940	119,515
Totals	46,867	1,355,887
Smelter receipts—		
Grand Forks	21,966	551,660
Greenwood	6,809	276,169
Boundary Falls	3,185	158,394
Trail	6,582	197,796
Nelson	.....	11,340
Northport	2,938	77,826
Marysville	600	25,200
Totals	42,080	1,298,385

Cobalt shipments for week ending October 19th were:—La Rose, 5 cars, 141 tons; McKinley-Darragh, 4 cars, 132 tons; O'Brien, 1 car, 32 tons; Drummond, 1 car, 32 tons; Kerr Lake, 1 car, 40 tons. McKinley sent 1 car to Perth Amboy, 3 to Denver, 3 to Toronto; O'Brien, 1 to Deloro; Drummond, 1 to Perth Amboy. Kerr Lake, 1 to Perth Amboy. The total is 368 tons, of which 131 tons, or over one-third, were sent to the Denver smelters.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending October 18th was 24,133 tons; daily average, 4,022 tons.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending October 11 was 19,612 tons, a daily average of 3,268 tons.

The production of gold at the Rand in September is officially announced at £2,284,425. The out-turn in August was 555,037 fine ounces, and in September last year 505,111 fine ounces.

The following table gives the output of gold at the Rand (in fine ounces) for a series of years:—

	1907.	1906.	1905.
January	537,638	428,638	369,258
February	493,542	407,668	363,811
March	538,497	443,723	399,823
April	537,019	439,243	399,166
May	524,477	461,202	416,395
June	507,559	475,975	412,317
July	532,711	491,793	419,505
August	555,037	509,115	428,581
September	538,034	505,111	416,487

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Oct. 12 Ore in lbs.	Since Jan. 1 Ore in lbs.
Buffalo	60,000	1,998,830
La Rose	87,000	1,316,852
McKinley-Darragh	144,720	504,980
Nipissing	61,010	4,151,301
Townsite	42,000	192,078

The total shipments for the week were 394,730 pounds, or 197 tons.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Oct. 19 Ore in lbs.	Since Jan. 1 Ore in lbs.
Drummond	64,830	108,920
Kerr Lake (Jacoubs)	59,950	433,730
La Rose	281,710	1,598,562
McKinley-Darragh	266,260	771,240
O'Brien	64,575	2,345,580

The total shipments for the week were 737,325 pounds, or 368 tons. The total shipments since Jan. 1, 1907, are now 20,087,875

pounds, or 10,043 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2,144 tons, valued at $1,473,196; in 1906, 5,129 tons, valued at $3,900,000.

New Dividends.

The International Coal & Coke Company have declared a dividend of two per cent. on all outstanding stock in their books on October 20th, to be paid in Spokane on November 1st.

Commercial Items

The Canadian Rand Company, Limited, of Montreal, have opened up a show room at 11 St. Nicholas street, where they display a complete line of air compressors, rock drills and Imperial pneumatic tools. A small stock of repair parts will also be carried in stock for the convenience of local customers. This is the only place in Montreal where such a stock is displayed, and it should add impetus to the already immense sale of Rand mining machinery.

The J. R. Alsing Company, 136 Liberty street, New York, founded in 1869, and organized under the laws of the State of New York, have changed their name to the J. R. Alsing Engineering Company under the laws of the State of New York, and increased their capital stock from $20,000 to $100,000. The officers will be the same as in the old company. The enormous increase in their business made them make the above change.

METAL, ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.

Antimony—10 1-4 to 12 cents per lb.

Arsenic, white—7 3-8 to 7 3-4 cents per lb.

Barytes, crude—$18 to $20 per short ton.

Bismuth, metal—$1.75 per lb.

Cadmium, metal—$1.50 per lb.

Carbons for drills—$70 to $80 per carat.

Carborundum, powdered—8 cents per lb.

Chromium, metal pure—80 cents per lb.

Cobalt, f.o.b. Cobalt, Ont., unrefined—30 to 40 cents per lb.

Corundum—7 to 10 cents per lb.

Feldspar, ground—$14 per short ton.

Flourspar, lump—$8 to $14 per long ton.

Graphite, domestic—$50 to $150 per ton.

Gypsum, lump—$7 per short ton.

Infusorial earth, ground—$20 to $45 per long ton.

Lead—4.75 cents per lb.

Manganese, pure metal—75 cents per lb.

Mica, ground—$50 to $80 per short ton.

Mica, scrap—$10 to $15 per short ton.

Molybdenum, pure—$1.70 per lb.

Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.

Nickel, metal—45 to 65 cents per lb.

Platinum, ordinary metal—$27.50 per ounce.

Platinum, scrap—$22 per ounce.

Pyrite—10 to 11 1-2 cents per unit for 38 to 45 per cent. sulphur, lump ore or fines.

Quicksilver—$40.50 per 75 lb. flask.

Sulphur—$19 to $23 per long ton.

Talc—$15 to $25 per short ton.

Tungsten, pure metal—$1.30 per lb.

Tungsten, ore, 60 per cent. pure—$9 per unit.

Tin—31 1-2 cents per lb.

MARKET NOTES.

Silver.—October 3rd, 66 1-2; October 4th, 66 1-2; October 5th, 66; October 7th, 65 1-4; October 8th, 65; October 9th, 64 7-8; October 10th, 63 5-8; October 11th, 63 1-4; October 12th, 62 3-8; October 14th, 60 3-8; October 15th, 61 1-4; October 16th, 61 1-4.

Mexican dollars, 47 5-8 cents.

Sterling exchange, $4.8635.

Pig Iron.—Pittsburg, Bessemer pig, $22; No. 1 foundry, $21.50; No. 2, $21.

Iron Ore.—Bessemer, old range, $5; Bessemer Mesabi, $4.75; non-Bessemer, $4.30; silicious non-Bessemer, $2.50.

Spelter.—Market steady. New York, 5.50 cents per pound; London, £21 15s.

Lead.—Market weak. New York, 4.75 cents per pound; London, £18 5s. for Spanish.

Tin.—Tin has dropped seriously. New York, 31 1-2 cents per pound; London, £138 10s. for spot.

Copper.—No improvement in the market. New York, lake, 13 1-2 cents per pound; electrolytic, 13; London, £60 for spot.

On October 16th the London price of bar silver reached the lowest point since August, 1906. At that time it was quoted at 27 1-4d. The closing of the Mexican mints to the free coinage of silver caused a decline of bar silver to 25 7-16d. in April, 1905. The continued buying of the Indian Government brought up the price to 30 5-16d. in December, 1905.

The Government of New Zealand is now offering a bonus on the production of marketable copper from ores mined and smelted in the country; and a bonus of four pence a pound on the production of the first hundred thousand pounds of quicksilver, free from impurities, from any New Zealand mine. In respect to copper, the conditions are that if 1,000 tons are produced on or before June 30th, 1909, the bonus payable will be £1,000; after that date, £500 will be paid on respectively the second and third thousand tons produced.

At the congress of miners of the centre of France, held recently at Commentry, one of the questions discussed was what attitude should miners assume in the event of war being declared. Finally a resolution to the following effect was passed: "The National Federation of the Miners of France ought to respond to a declaration of war by a general strike." This in no wise discounts some of the unpatriotic utterances of certain anarchistic delegates to a labor convention at Winnipeg.

According to a report of a commercial agent of the United States Government, Afganistan is an extraordinarily rich mineral country. It is known to have mines of rubies, topaz, lapis lazuli, marble, iron, lead, copper, antimony, and other metallic ores, as well as sulphur and several of the earthly alkaline and metallic salts. Coal is also found. The lead, iron and precious stone mines are partially worked by the Government with modern machinery, but the mining of the country is mostly carried on by the crudest of methods and the bulk of the mineral wealth is not yet touched. The Amir continues to gradually purchase mining machinery as he has funds; but both Government and people are opposed to granting any concessions to foreigners.

SOUVENIR HAND BOOK

A.I.M.E. TOUR

THROUGH

COBALT, SUDBURY AND MOOSE MOUNTAIN

OWING to the extreme care necessary in handling the colour press work in printing this volume the publishers have been unable to bring it out as soon as was hoped. It is now ready.

Orders have been received for a large number. It is probable that a second edition will have to be printed. The publishers will consider it a favor if intending purchasers will send in their orders as promptly as possible. In this way the need of a second edition can be determined early.

ROOFS
That Stay Roofed

The strongest wind that ever blew can't rip away a roof covered with self-locking

"OSHAWA"
GALVANIZED
STEEL SHINGLES

Rain can't get through it in 25 years (guaranteed in writing for that long—good for a century, really)—fire can't bother such a roof—proof against all the elements—the cheapest GOOD roof there is.

Write us and we'll show you why it costs least to roof right. Just address

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the anadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

HUNTING TRIPS

THERE is no Railroad in America, probably in the world, that can bring Sportsmen within touch of so many famous haunts of big and small game as can the Canadian Pacific. From the lordly Moose of Nova Scotia and New Brunswick to the Bear and Mountain Goat of the Rockies is a far cry but it is C.P.R. all the way, traversing en route hundreds of miles of ideal hunting country.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal lands may be purchased at $10 per acre for soft coal and $20 for anthracite. Not more than 320 acres can be acquired by one individual or company. Royalty at the rate of 10 cents per ton of 2,000 pounds shall be collected on the gross output.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 an acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

Underwood

The Underwood Unit, Bill or Order Typewriter, is used to facilitate the handling of bills or orders.

The order is made out upon a set of unit forms, as many as may be required for different departments. The original is the invoice; the second, an office copy or price sheet; the remaining copies may consist of acknowledgments, requisitions, shipping memoranda, etc., which are distributed to the various departments after the order is entered.

The forms may be so designed that each will contain only the information required by its special department. Let us send you a book about it.

United Typewriter Co., Limited, Adelaide St. East, Toronto

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41 015,697 of Lode Gold, $25,586.008 of Silver; $17,625.739 of Lead; $35 546,578 of Copper; $79 334.798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

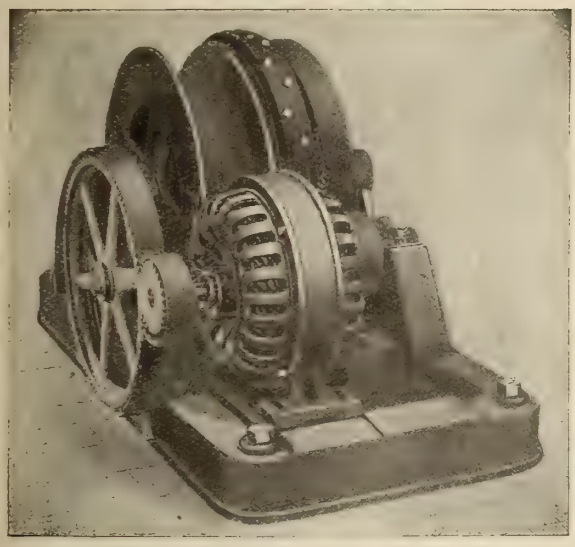
$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.



Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

Westinghouse Motor--Drive

For Mines

There is no other method by which mine apparatus can be so efficiently operated. It allows machines being moved about at will and relocated with the greatest ease, and of their being controlled from any convenient point. There is practically no loss in power transmission.

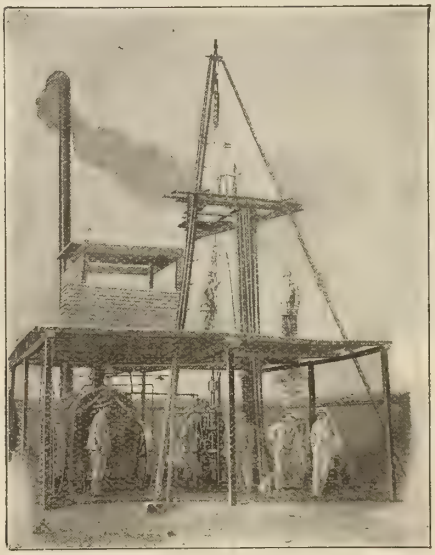
The First Step—

In the exploration and development of mineral property, should always be through DIAMOND DRILL PROSPECTING.



A diamond drill core indicates the exact position, extent and quality of the mineral sought, and the character of the strata overlaying and surrounding it.

The operator may thus estimate the cost of developing and working his property, and of preparing the product for market, before spending a cent for shafts or tunnels.

Sullivan Diamond Drills are built in over 25 sizes and styles, for prospecting work of any nature and under any conditions.

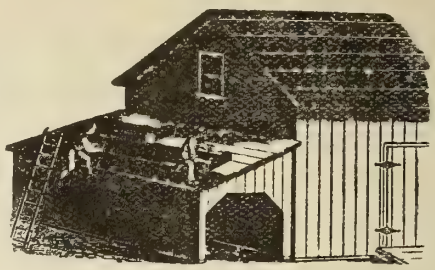
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

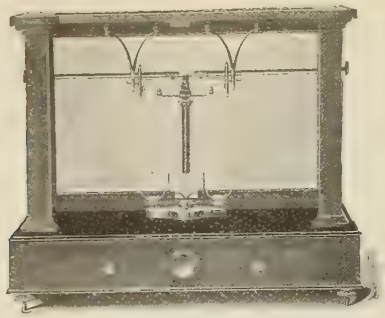
Leading Features of a Good Rock Drill

No. 4.—The Piston and Chuck

The Piston, piston rod and chuck of the Rand "Little Giant" rock drill are of one solid forging of the highest grade of steel for the purpose, carefully treated by oil tempering and case hardening to give great strength



and hard wearing surfaces. The rocker actuating surfaces, the rod and the chuck, are all strong enough to withstand the tremendous strains to which they are subjected by the powerful blows of the drills. In fact the complete drill is the lightest and most rugged machine built.

The Canadian Mining Journal

With which is incorporated the

"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada

Published fortnightly by the

MINES PUBLISHING CO., LIMITED

Head Offices - Confederation Life Building, Toronto, and 171 St. James Street, Montreal.

Branch Offices Halifax, Victoria, and London, Eng.

Editor:

J. C. MURRAY, B.A., B.Sc.

Business Manager:

J. J. HARPELL, B.A.

SUBSCRIPTIONS—Payable in advance, $2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, $3.00 a year.

Advertising copy should reach the Toronto Office by the 8th, for the issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

SPECIAL CONTRIBUTORS

GEOLOGY: Dr. Frank D. Adams, McGill University; Dr. A. E. Barlow, late of Geological Survey of Canada; Professor Willett G. Miller, Provincial Geologist of Ontario; Dr. J. E. Woodman, Dalhousie University, Halifax, N.S.

CHEMISTRY: Dr. W. L. Goodwin, Director School of Mining, Kingston, Ontario; Milton Hersey, M.Sc., Official Analyst Province of Quebec.

MINERALOGY: Professor W. Nicol School of Mining, Kingston, Ontario.

MINING: S. S. Fowler, M. E., Nelson, B. C.; Frederick Keffer, M.E., Anaconda, B.C.; A. B. Willmott, M.E., Sault Ste. Marie, Ont.; J. C. Gwillim, M.E., School of Mining, Kingston, Ont.; J. Bonsall Porter, M.E., McGill University; John E. Hardman, M.E., Montreal; Fritz Cirkel, M.E., Montreal; H. Mortimer-Lamb, Sec'y C.M.I., Montreal; George W. Stuart, M.E., Truro, N.S.

METALLURGY: Hiram W. Hixon, M.E., Mond Nickel Company, Victoria Mines, Ontario; Stafford F. Kirkpatrick, School of Mining, Kingston, Ontario; A. P. Scott, Dominion Iron & Steel Co., Cape Breton.

COAL: Hon. Robert Drummond, Stellarton, N.S.

NATURAL OIL AND GAS: Eugene Coste, M.E., Toronto, Ont.

CEMENT: Manley Baker, M.A., School of Mining, Kingston, Ont.

ENGLISH AS SHE IS WROTE.

Though it has been pretty well known for some months past that the Geological Survey of Canada intended publishing a monograph on Niagara Falls, whispers have lately circulated in scientific circles that the report was held up on account of differences between the author and those in authority as to the merits of the work.

A very short synopsis of the report has been published, by the author, Dr. J. W. Spencer, in the October issue of the Geological Magazine, and if it be a sample of the work submitted to the Geological Survey, surprise at its non-appearance will be small compared to curiosity as to the statements it upholds.

The two pages referred to contain a few opinions regarding Niagara Falls and a great many opinions regarding Dr. Spencer's connection with them. Nature and the Almighty have, it seems, had very little to do with the Falls themselves, for Dr. Spencer nobly assumes full responsibility. The doctor tells us in, practically, the only grammatical sentence included in the two pages, that "Almost all the physical changes in the history of Niagara Falls have been made by me, at different times." It is a large and comprehensive statement; it is a statement that upsets some of our choicest geological theories; it is a statement that makes us despise most of what we absorbed in our Science course, but we believe the doctor—though thousands wouldn't.

Hard must it press, however, on the staid and solid Survey to accept the doctor's personal interference with poor Niagara; easy for all to understand the reluctance to give it publicity.

If the powerful professor whose almighty arm, as the hymn says, has played such havoc with the topography of this Province, had stated the rest of his premisses in grammatical English the Geological Survey might have doubted, but could never have misunderstood, his claims. A genius, however, is seldom a cosmopolitan genius, if one may use the term, and the difference the professor has made in our Falls is scarcely inferior to the indifference with which he treats our Mother tongue. What, indeed, is mood compared to metamorphism, and why should tenses trouble when terraces attract? Why indeed? They shouldn't, and they don't. Is it to be presumed that the professor—wielding a power almost creative—is likely to be trammelled by grammatical conventions? The man in the street may foster the belief that what is written is intended to be understood, but he fails to appreciate the triple advantage of Dr. Spencer's prose—it may mean anything at all, or nothing at all, or something quite different, and is naturally worth three times the money.

Joking apart, however, it is really sad to see one of our Canadian writers hold himself up to ridicule in an English magazine, and we look forward with some interest and a large amount of apprehension to the coming publication of the Geological Survey.

A VISIT TO LARDER LAKE.

A visit to Larder Lake is education—rapidly and comprehensively education. Heaslip, an inhospitably small station on the T. & N. O., is the starting point for what is probably the better trail of the two. At Boston the other trail begins.

After a good frost one walks from Heaslip to Tomstown, three miles, over a well-laid and level road. From Tomstown to Wendigo, where the alternative of a canoe route is offered in summer, the first few miles are execrable in soft weather, passable in frosty weather, and must be delightful after the snow flies. Settlers, mostly Englishmen, have taken up small farms along the road. The soil, slayey or gravely, as one may choose, is remarkably fertile.

Wendigo, seven miles on, we found in a state of interseasonal quiet. Long rows of canoes (we counted forty at least) were stacked in frames for winter storage. We were told that already the smaller lakes were frozen over and that one sharp night would close the whole route to Larder. A water power of not inconsiderable dimensions exists here.

The trail from Wendigo to Tremblay's (Half-way House) is, for the most part, over clean gravel ridges. The walking, even when the rains descend (and descend upon us they did) is excellent.

From Wendigo on to Fitzpatrick's Bay on Larder Lake the road measures eight or nine long, heavy miles. From the bay a paddle of four miles takes one to Larder City.

For reasons various and apparent Larder City is sitting on her heels. Transportation is almost out of the question and will be until snow comes. The only symptom of mining near the "City" is to be seen on the Harris-Maxwell claims. The lake shore is dotted with empty camps, prospecting shafts and test pits.

Larder Lake is a deep and unquiet body of water. In its cold waters the lusty lake trout, the predatory pike, the piratical pickerel, multiply surprisingly. These hardy fish are firm of flesh and make sweet eating. Of wild duck we saw many. Through the long trails over the hills we disturbed dozens of partridge.

We also came upon signs of certain beasts of prey. The track of the wild cat was not hard to read. Winter-staked claims, discovery posts cunningly hidden by ambiguous legends on the corner posts or placed merely on an outcrop of country rock, or not placed at all, these are signs which he who runs may read.

There are two errors that obsess the average prospector in the Larder Lake district. The first is that quartz, of itself, constitutes a valuable discovery. The second is that a vein or dike must improve to the deep—usually in a geometric ratio. Neither conclusion is sound; indeed both are baseless.

All generalizations regarding mineral deposits should be received with a full appreciation of possible exceptions.

Whilst it is true that Larder Lake is yet far from being a proved mining district, we have not and we do not make this statement with the intention of injuring the district. Incalculable harm has been done already by newspaper advertisements and reading notices. A totally false impression has been created in the public mind. It has been announced that the district is an enormously rich one. This is false. But brokers and promoters have used the daily papers all over Canada to create this impression and, with the help of the various champions of the people, they have obtained money from thousands of poor folk under false pretences. A little common business sense upon the part of the daily newspapers would have obviated this. The least investigation would have elicited the truth about Larder Lake. But investigation was not made and the readers and subscribers of our powerful dailies find themselves betrayed.

Of the thousands of dollars subscribed by the public to develop Larder Lake mining claims by far the greater part has been divided between the newspapers and the promoters. This is a cold, irrefutable fact.

It is obvious that in common justice the newspapers must be held as parties to the crime. They constituted the only medium through which the promoters could appeal to the public. Had they denied the use of their columns to the wild catters Larder Lake might now have been a thriving camp, producing gold bricks instead of tragedies.

The end is not yet. When the story of fraud, waste, theft and incompetence is complete we believe that Toronto newspapers will revise their code of morals. No logic can justify a participation in the fruits of knavery.

This, however, is a digression. We feel strongly upon the subject.

We wish to conclude with an expression of opinion as to the present and future of Larder Lake.

What Larder needs, more than anything else, is a group of strong, competent mining engineers who will be free alike from the pernicious influence of promoters and from the hampering interference of directors.

Up to the present there has been (with one or two notable exceptions) no evidence of clean, intelligent mining. Stores have been wasted. Machinery has been transported over summer roads at paralyzing cost. Materials of construction have been ordered at any price and with no reference to the especial needs of the mining property. Much of this has arisen from the fact that wild cat companies do not care to employ reputable professional men.

The above is not true, we are glad to add, of several mining properties in Larder Lake. There are honest companies whose mistakes are mistakes of ignorance. But not more than two or three have settled down to an honest attempt to develop a mine.

All available facts indicate that Larder Lake, if it survives, will become a low grade camp. What this means very few people appreciate. For one thing it implies the careful expenditure of large sums of money, first in exploring the ore bodies and then in erecting commensurately extensive plants. These steps will take at least three years. Not before many years more have elapsed can dividends be expected, if dividends there are to be. Over and above all the district needs experienced, careful mining engineers who will conserve the funds entrusted to them and expend them wisely and well. Larder Lake cannot support the horde of promoters who now are sucking her blood.

On our way to Larder we met seven miners, employees of the Larder Lake Proprietory Gold Fields, Limited. They were walking out from Larder without enough money to pay for their meals on the way. For three months, so they informed us, they had not received a dollar of pay. Also they complained of lack of decent food. Ordinarily complaints of this sort are not to be taken seriously. In this case, however, we feel justified in making public the facts of the case.

About one mile from Fitzpatrick's Bay we came upon thirty bags of flour, stacked on the ground, with an insufficent shelter of boards. Here they had lain for weeks exposed to the weather and to the attention of the beasts of the field. Half the bags were torn open. The flour was spoiled beyond use. When one remembers that transportation alone cost between four and six cents per pound to this point, it becomes impossible to furbish up an excuse for negligence such as this.

These things must stop. The country cannot afford to have money thrown away.

NEEDED—A DIRECTOR.

Upon the recent organization of the Mines Department at Ottawa, Dr. A. P. Low was appointed Deputy Minister. Under his care were placed the two divisions —the Geological Survey and the Mines Branch. Dr. Haanel is Director of the latter. Dr. Low is still, nominally, the Director of the former.

The burden of administrative work falls heavily upon the Deputy Minister. It is understood that, to allow him to do justice to his higher duties, a Director must soon be appointed to take over the actual management of the Geological Survey.

Upon the staff of the Survey are many faithful servants who have served their time and who should be retired with honor. No one of these is capable of pulling the Survey out of the rut into which it has fallen. Reorganization must be left to a young and vigorous man. His appointment must not depend upon politics. His hands must be free to smite and to build.

A political appointee would be a misfortune.

Of all Federal appointments this is the one that most concerns mining men. The Government choice will be influenced largely (indeed it should be decided wholly) by the recommendations of such bodies as the Canadian Mining Institute. The man chosen must be not only a geologist—he must be a fearless, just and capable manager. There is restlessness and dissatisfaction among the younger members of the Survey staff. The new Director must deserve and win the respect of these men, and must also have the earnest co-operation of the older men.

Editorial Note.

New Brunswick will soon become a producer of iron ore. At Bathurst and at Lepreaux work is being done in substantial deposits of magnetite.

Urgent enquiries are being made of us as to possible sources of molybdenite. We shall be glad to hear from any of our readers who are in a position to ship this ore. A large market demand is developing.

Technical education is making headway in Nova Scotia. The system of schools is somewhat clumsy. But under its present energetic management there is no doubt that good results will follow. In no other Province of the Dominion is so much attention being paid to the education of workmen.

The *Canadian Engineer,* in a recent issue, referred to the Atikokan blast furnace as the "first blast furnace to produce pig iron from all-Canadian ore." This is quite incorrect. For years the Londonderry Iron & Mining Company's furnace at Londonderry, Nova Scotia, has been producing pig iron from domestic ores. Moreover, the Radnor charcoal furnace at Radnor, Quebec, has been doing the same. Also a considerable number of charcoal furnaces in Quebec have in the past used entirely Canadian ores. Our contemporary should avoid dangerous ground.

As we are going to press telegraphic advices have been received to the effect that the Granby smelter has been closed, throwing at least two thousand men out of employment. The low price of copper is said to be the immediate cause of this unfortunate event. A contributory cause has been the excessive wages paid to workmen. A rigid minimum scale of wages is a serious detriment to any industry. In hard times it should be possible, easily possible, to adjust wages to conditions. Unions, for their own good, should make this a recognized principle. The labor organizations very promptly demand a share of profits when trade is good. They should not expect employers to bear all the burden when depression comes.

NO "UITLANDERS" NEED APPLY.

Having ransacked the world's scientific centres and attained to that perfection where the metallurgical engineer is being requisitioned to solve close questions remaining unsolved, it is proposed by the leader of the Opposition to the Jamieson Administration at the Cape that South Africa shall proceed instanter to be self-sustaining in the matter of geologists, mining experts, miners, engineers and metallurgists.

No country has profited more fully than South Africa from the brain products of Freiburg, McGill, California and Stanford, Cornell, the Royal Schools of Mines, and technical institutes generally; nowhere has a higher premium been paid to the specialist. Becker, Molengraaff, Williams, the Jennings, Hammond, Ross Browne, Corstorphine, Hatch, Webb, Yeatman, Iaverneh, Raymond, Webber, and others of more or less note, were commandeered by Hamilton Smith and his successors in the exploitation of the low grade bankets of the Witwatersrand and diamond mines of Griqualand West, Orangia and the Transvaal. Coarse crushers and the Californian stamp reduced exceptionally hard rocks to requisite meshes. The Home Country's improvised cyanide process released precious gold contents otherwise not economically extractable. Filter presses, conceived in Germany, rock drills, diamond drills, all the appurtenances of mining at great depths, were provided by foreign instrumentalities.

A section of South Africans, born in the sub-tropics, recognizes all this, and would have been worse off had it not been so, but it is the fatuous contention of those so holding, that diamonds and gold leaving that country offer no permanent substitute, consequently mining is to be measured, industrialism divorced from the prime factor of profit in the tonnage turnover, and ultimately the foreign authority is to be given "Paddy's Rise." Mr. Merriman, once a party to the Rhodes amalgamation of Kimberley interests, and now the leader of the Bond or South African party at the Cape, outlines this programme. Upon this platform he seeks to effect the federation of South African States. A Government monopoly in wines and liquors, together with training institutions precedent to the implied exclusion of foreign talent, completes the Merriman conception of the fitness of things. When this has been accomplished, he argues, there will be no occasion for outsiders. Nothing, however, is said of the competency of those undertaking all this to find the millions of fresh capital for which there is urgent demand from the directorates of non-producing or undeveloped properties which are unlikely to place a set of timbers until the Rand's credit improves.

Because the Witwatersrand is the greatest of goldfields, its concentrated riches being so unique as to permit of large capital expenditure in the reasonable certainty of return on the same over a fixed period, anything pertaining to technical mining chiefs there employed is of international importance. The diamond mines of Kimberley have left little to be determined in the treatment of "blue ground" contained in the "pipes" or the recovery and classification of the gems. Economics in breaking rock and bringing it to mills, in expediting cyanidation, in secondary agencies, in promoting the efficiency of labor units, white and black, are still in the making. Recently stamp duties have been increased, extraction has attained to 95 per cent. and over of assay values. Stoping devices promise important curtailments in costs. Explosives are half what they were ten years ago in the item of mining. Spraying and ventilation regulations have minimized the risks of phthisis.

Such are the benefits of interchanges of knowledge. Had Bantjes and Struben been left to their own resources their discovery of the auriferious "bankets" would have been insignificant. It was the adaptation of cyanide and what has followed, the enterprise of Fraser & Chalmers, Gates, Allis-Chalmers, Ingersoll-Sargent, the General Electric Company, Westinghouse, Sandycroft, Babcock, Koppel & Company, the Jeffrey Company, and hosts of others, that induced promoters to wisely and unwisely capitalize the Witwatersrand at £300,000,000 and more. Mr. Merriman was one of the beneficiaries of this industrial progression. He now takes the insular rather than the intercontinental view revealed in Rhodes scholarships and endowments and Beit bequests. Where he errs is, in the contention that South Africa has chapter and verse, precept on precept, for what its young men should know in order to supplant Canadian, American, British and German scientists. The sooner he unlearns or sets aside these conceits, the quicker will be the recovery of a gold-getting industry upon which international exchange markets are impinged.

Under the Milner Administration, counselled by a Technical Commission and Prof. Hele-Shaw of Liverpool, the Kimberley School of Mines was absorbed by the Transvaal authorities and became the nucleus of a high class collegiate institution for the benefit of young colonials and those employed in the mines. "Nowhere," said Prof. Shaw to the writer, "is there such a perfect training ground as the Witwatersrand. Here you have the most up-to-date mechanism, the most modern methods, an infinite variety of material for experimentation." The late Mr. Beit provided in his will for this Transvaal University. Hardly had his will been probated when it was proposed to locate this technical institution at Pretoria, thus throwing into disuse the ground previously donated by the member of the firm of Wernher, Beit & Company, the ramifications of which are world-wide. The historic rivalry between the political capital, Pretoria, and the industrial capital, Johannesburg, again asserted itself. Rather than do as Beit decreed, as Sir Julius Wernher in greater degree is now striving for in London, the disposition seems to be to accept the Merriman dictum that South Africa must be up and doing for itself—a proposal that is excellent in principle, though ill-advised when premised upon proscription, however remote that policy must be in its consummation.

Scientific living to learn has universal interdependencies. The outside expert and technical adviser does not always make the most efficient inside counsellor and friend. On the other hand, "the new man in the camp" commands respect. South Africa has the raw material with which to promote great enterprises. It has produced a dozen wealthy mining speculators—Robinson, Bailey and others—and several capable engineers and mine managers, among the engineers being Greathead, who first projected the London "Tubes." In the work of pioneering the sub-continent has distinguished itself, but when it is claimed that those colonies can become self-sustaining in matters of research and capital, Mr. Merriman might as well advise that Canada should do the same, that emigration is prejudicial, that scientific associations are unnecessary evils, that free trade in ideas is not to be entertained.

Canada stands foremost with Germany in its popular and higher educational systems. The United States, with all its wealth and educational resources, has taken leaves out of the teachings of pedagogues of all nations. The Mother Country is awake to its own shortcomings. South Africa has excellent material for much of what Mr. Merriman suggests, yet when that gentleman decries prevalent pessimism and advocates the narrower view in order to gain political advantage, he becomes as pastoral as his "backveld" constituents.

Apropos to the foregoing, the London *Daily Mail* of October 2 has this on another phase of the Merriman-Bond party programme, in which Gen. Botha is co-operating:

VICTORIA FALLS AND THE RAND.

While Mr. Mershon is talking of the practicability of conveying power from the Victoria Falls to the Rand, the *Glasgow Herold* has unearthed a speech much to the point by General Botha, delivered on August 24, which, it says, has hitherto remained unreported. General Botha, according to our contemporary, "speaking at Standerton at a meeting of Boer electors, declared that the Transvaal Government would oppose the introduction of electric energy from the Victoria Falls—that is, the grant of the way-leaves necessary. The argument of the Prime Minister of the Transvaal was that this proposal would ruin the coal mining industry of the Transvaal, and incidentally reduce the colony's revenue from the mineral traffic of its railways."

How ridiculous all of this is will appear when it is recalled that the Botha-Merriman party opposed Chinese labor, demands prolongation of production irrespective of returns on capital, and now threatens a power scheme which might save the industry from the embarrassments arising from political wrangling. Many doubt the feasibility of power transmission all the way from the Zambesi to the Vaal River. Mining firms are taking the risk because their power bills are very large. For Mr. Merriman to advocate what he does, and Gen. Botha to threaten the Victoria Falls scheme, rather than recognize the advantages of domestic economics of the Government, leaves capital more than ever indoubt regarding South Africa.

ALEX. GRAY.

Liverpool, Oct. 2, '07.

THE DELORO MINING AND REDUCTION COMPANY.

I.

A smelting establishment, as interesting as it is unique, has been completed at Deloro, Ontario. The cause of its erection was the crying need of a Canadian metallurgical plant that would treat the arsenical ores of the Cobalt district. Such a plant, of course, does exist at Copper Cliff. But the increasing output of Cobalt camp, the complexity of the ores, and a growing sense of the futility of shipping ore to American smelters, pointed indisputably to the necessity of building a new plant.

Deloro is historic ground. The superintendent of the Deloro Mining & Reduction Company, Mr. P. Kirkegaard, has played an important role in the development of the famous gold-arsenic mines of the district. It may then be not irrelevant to incorporate a short sketch of Deloro's mining history in this article.

I shall not attempt to trace the mining activities of the famous Deloro mine farther back than 1898. The mists of nine or ten years are hard enough to penetrate. The rising generation thinks in years, not decades.

The year 1898 witnessed the reopening of the Deloro mine after a shut-down. The Gatling, Tuttle and Keswick shafts were deepened to 192 feet, 122 feet and 50 feet respectively. Eight hundred and seventy-eight feet in all of levels were reported in the mine. A new 10 stamp mill, a bromo-cyanide plant, a well-fitted laboratory and a new power house were added during this year.

Great progress was made in 1899. Not only were extensive underground developments carried through, but the plant was enlarged so as to include the process of arsenic recovery. The owners, the Canadian Gold Fields, Limited, were now successfully extracting gold and arsenic from the Deloro mispickel ores.

The concentrates from the stamp mill after being treated with bromo-cyanide were dried and roasted in a revolving cylindrical roaster. The volatilized arsenic trioxide was then condensed in a series of brick chambers with vertical baffle walls and collected from these chambers. The product was refined by re-roasting and re-condensing.

Important enlargements were projected and begun in 1900. The stamp mill was doubled in capacity. Wilfley tables, Bartletts and Frue Vanners were installed, and an extra vat for the cyanide plant was built; the arsenic plant, moreover, was completely reorganized; and underground development was not neglected.

In 1901 operations were continued on a full scale. Improvements and additions were constantly being made.

Calamity overtook the mine in March, 1902. A heavy flow of water was encountered in sinking a winze from the fourth level. As a consequence mining was stopped and the stamp mill ran out of ore. The arsenic plant, however, continued treating concentrates and ore from other properties.

There had been, meanwhile, much talk of consolidating the various mispickel properties of the Marmoro region and of centralizing operations at Deloro. Nothing came of this. Work was then suspended at the mine and plant of the Canadian Goldfields, and was not resumed.

The production of arsenic from 1899 to 1902 inclusive, all of which is credited to the Deloro works, is shown in the following table:—

Year.	Tons.	Value.
1899	57	$ 4,842
1900	303	22,725
1901	695	41,677
1902	800	48,000

The suspension of operations was due mostly to a heavy drop in the price of white arsenic. The intricate problems asociated with the reduction and smelting of the ore and with the recovery of arsenic and gold had been attacked and solved by Messrs. Kirkegaard and Wright. The mine and plant had been brought to a condition of great efficiency. But an absentee board of directors and a depressed market turned the tide.

It will throw light upon the present work of the Deloro Mining & Reduction Company to glance for a moment at the methods employed by their predecessors.

As to the form and origin of the Deloro deposits, Dr. W. G. Miller confirms the conclusions reached by Mr. Kirkegaard. In the Eleventh Report of the Ontario Bureau of Mines, Dr. Miller writes thus of them:—

"The ore . . . consist essentially of mispickel . . . together with gold in quartz. Associated with the quartz is considerable dolomite and calcite. This latter mineral frequently contains iron in the ferrous condition . . . Iron pyrites in much smaller quantities than mispickel is also present. Copper pyrites is found at time . . . Secondary minerals, such as hematite, arsenolite and chlorite are also present. The mispickel at times occurs well crystallized in characteristic forms.

"Gold is found in visible grains and scales in the quartz and associated with the mispickel, sometimes, but rarely, occurring in minute rounded grains attached to the faces of mispickel crystals. The greater part of the gold is, however, mixed through the mispickel in a very finely divided and invisible form . . . The diorite in which the ore bodies are found at the Deloro is finer in grain than at the Belmont mine. There appears to be two varieties of dark colored rocks in this vicinity, one of which is clearly of igneous origin, holding fragments at times of the other. The latter may be different in origin from the former and is often closely associated with crystalline limestone or calc schist . . . The ore bodies in the diorite cut across granite dikes, as is evident from the dump heap . . . Since dikes of granite are never found cutting through or disturbing the ore bodies, it is evident that the fissures or cavities now occupied by the ores were formed subsequently to the period when the granite cut through the diorite . . . Along the walls where the diorite has been decomposed the rock is a schist, talcose or chloritic in character. The edges of the ore lenses pass into this schist, which is distinctly laminated. When rock of this character is met with in the workings it is an indication that an ore body is near at hand."

A further extract from papers read by Messrs. Kirkegaard and Wright before the Canadian Mining Institute at Montreal in 1901 describes the treatment of the ore.

"A modern system for hoisting, sorting and carrying the ore a distance of 800 feet to the mill has been adopted. There are 20 stamps weighing 850 pounds each, 10 dropping 100 times to the minute with 6 to 7 inches drop. Screens are 40 mesh burr slot. Crushing capacity is 80 tons a day. The average saving is 57 per cent. of assay value by amalgamation only. The concentrating plant consists of three hydraulic classifiers, and five 6 foot smooth belt vanners for the old 10 stamps; and three Wilfley tables, one classifying cone, and one Bartlett table for the new 10 stamps. The tailings carry only 2 to 2.5 per cent. of the original gold values and 0.5 per cent. of the arsenic contents of the milling ore. The concentrates are transported in cars to the leaching plant, where they are treated by the bromo-cyanide process. This consists (1) Extraction of gold by leaching the finely ground ore with a solution of potassium cyanide to which is added a small quantity of a solution of cyanogen-bromide—a haloid salt of cyanogen; (2) precipitation of the gold from this bromo-cyanide solution by means of metallic zinc; (3) removal and smelting of the zinc-gold slimes, thus obtaining the pure gold.

NEW COBALT PLANT—LOOKING NORTH-EAST.

"The plant now in use, situated in a two storey building below the mill, consists of four leaching vats fitted with sand and pebble filter bottoms and bottom discharge gates, four solution or 'liquor' tanks on the floor above, three small Northey duplex steam pumps for circulating the liquors, three small 'sump tanks,' each of 40 gallon capacity, two 50 gallon tanks holding stock solution of cyanogen-bromide, one Salman's patent precipitating cone for zinc fume, filter press, one zinc box pipe systems, one acid treatment tank, one settling tank and one filter tub. The extraction of gold from the concentrates gives an average of 90.5 per cent. This with the values saved by amalgamation gives a total

NEW COBALT PLANT—LOOKING NORTH-WEST.

saving of 88 to 90 per cent. of the original gold contents of the ore, a result which, as an average of two years' steady work, is generally admitted to be exceptional on so refractory an ore. The concentrates, after the extraction of the gold, are sent to the arsenic works, where they are calcined for the arsenical contents. The crude arsenic resulting from the roasting is refined, and produces white arsenic of a pure white color, analyses of which show 99.6 to 100 per cent. pure arsenious oxide (As_2O_3). The production is eighty tons per month."

The reader will gain from the above a fair conception of the manner and scale of operations conducted by the Canadian Goldfields, Limited. It may be remarked that the Deloro plant stands unique in America.

II.

After a year or more of preparation the plant of the Canadian Goldfields has been remodelled, large additions have been made and the new, complete and modern metallurgical establishment operated by the Deloro Mining & Reduction Company has commenced treating ore from Cobalt.

The crushing department of the establishment is equipped with one Blake crusher, 7 inches by 10 inches; high speed rolls, 8 inches by 24 inches; and a No. 5 Krupp ball mill. The ore, after crushing, is elevated to the upper floor in cars on a 6 foot by 6 foot platform elevator. Both floors are provided with a system of rails and turntables to facilitate moving of cars from the various departments to the elevator; and again from the elevator to the bins. The ore is elevated to the top floor, emptied into large steel stock bins and thence fed automatically to sampler. One-tenth of the ore is cut out for a sample and is then taken to sampling floor.

Sampling Department.—The sampling department consists of two rooms, one having a smooth sampling floor of concrete, the other containing a complete set of sampling machinery. This machinery includes rock breaker, sample grinder, pebble mills, bucking plates, screens, scales, moisture scales, drying oven, etc.

The bulk ore, after being fine-milled and weighed, is elevated to a steel hopper from which it is fed automatically to a Snyder sampler, which is set to cut out 10 per cent. of the ore.

New Cobalt Plant and Old Arsenic Works—Looking East.

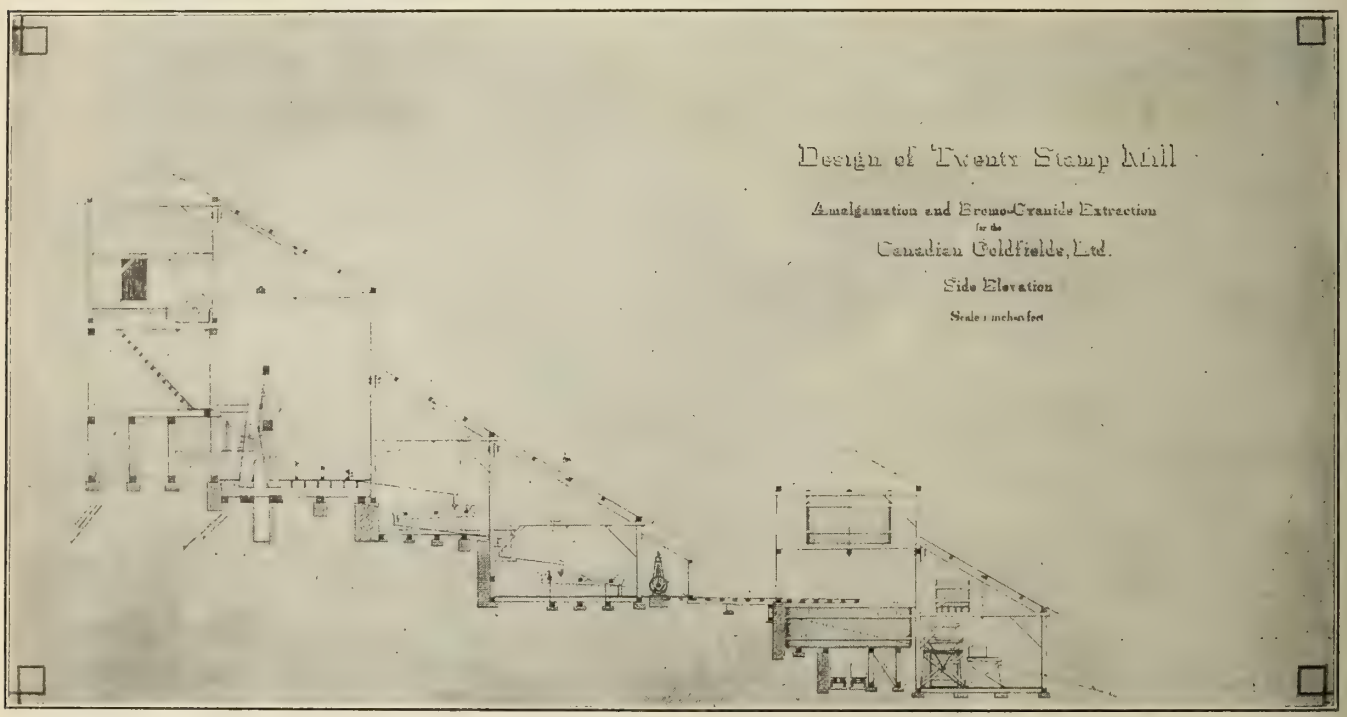
Interior of Arsenic Works—Condensing Chambers.

This 10 per cent. is again fed to a Snyder sampler, the quantity thus obtained being taken in a closed buggy or barrow to the sampling floor. Here, after thorough mixing, it is coned and quartered.

The first quarterings of this sample are divided into two distinct samples, which are again quartered down independently of each other.

The duplicate samples thus obtained are ground in pebble mills after weighing. This obviates losses by dusting. The metallics are separated on a 100 mesh screen, and weighed and assayed separately.

From each of these final pulp samples six sets of laboratory samples are drawn, the remainder of pulp being sealed up and retained until settlement is made for the shipment of ore.



The six sets of samples above mentioned are sealed in the presence of the shipper's representative, two samples being handed to the latter, two to the Deloro Mining & Reduction Company's sampler and the remaining two retained for umpire assay in case of any disagreement in shipper's and smelter's assays.

room is composed of two glass partitions. This permits the shipper's representative to see the whole operation of weighing, quartering, etc. He also sees the taking of the bulk sample. The arrangements at this point are most ingenious. Every inch of space has been utilized to the utmost advantage.

The crushed ore after sampling is again elevated to a series of stock bins. For storage both of a large quantity of any given ore and of considerable quantities of different ores, capacious steel bins are provided. Large platform scales are placed on the first and second floors. Under the bins scales also are placed to weigh out aliquot amounts of ore for treatment. All the bins are fitted with gates. A system of tracks and turntables under the storage bins reduces traffic to a minimum.

As the ore is taken from the bins it is again weighed accurately and is transported to that section of the plant where it will meet with treatment best suited to its requirements.

A large revolving cylindrical drier, designed at Deloro, is being completed.

When practicable the metallics from the screening of these samples are similarly divided into three portions.

The metallics obtained from milling bulk ore are melted into bars which are weighed and sampled by drilling. A special mill is used in the sampling room for reducing the drillings to the necessary degree of fineness for final sampling and assaying.

All final quartering of samples is done on a table fitted with a plate glass top, which presents an ideal surface for this particular work. It is at this stage that errors are most apt to creep in. As the samples are reduced to smaller and smaller size the dangers of contamination increase. A wooden surface is retentive of the finer particles of ore and metallic silver. An iron surface wears unevenly and fragments of its surface are often included in the sample. A glass surface is smooth, hard, readily cleaned and easily renewed in case of accident.

The sampling department occupies the north end of the new building. The passage between the crushing department and the laboratory section of the sampling

In treating custom ore the Deloro Mining & Reduction Company will pay not only for cobalt (above a certain per cent.) but for arsenic also. Full value of course will be paid for the silver contents of ores received. As the capacity of the plant is enlarged the full benefits of this policy will be felt in Cobalt and newer districts. But most particularly will the reopening and enlargement be felt in the district of Deloro. The plant has an output capacity of three tons of white arsenic per diem. It will thus be able to handle a large quantity of arsenical pyrites without interfering with its functions as a reducer of Cobalt ores in the slightest. It is now prepared to treat about 20 tons of Cobalt silver ores per diem. Many of its units, however, are sufficiently large to allow for twice this tonnage. It is therefore only a matter of time and slight additions of machinery before 40 or 60 tons may be treated daily.

The old plant was a large one. The new two storey building measures 30 feet by 150 feet. An ell extends from this measuring 60 feet by 100 feet. The old plant,

GENERAL VIEW OVER DELORO MINE—LOOKING NORTH.

all of which is now in commission, measured 60 feet by 150 feet.

The stamp mill, which is in excellent condition, presents more points of interest than can well be enumerated here. Manager Kirkegaard has for years past carefully changed and improved his milling practice until now the stamp mill embodies the last word of modern methods.

The general equipment of the stamp mill has been described already. A Vezin sampler has been added. A crushing capacity of 75 tons of ore per diem is attained with the stamps dropping 100 and 110 to the minute. The height of drop is 7 inches. To secure this rapid drop Manager Kirkegaard has designed a cam with a special involute. Even at 110 steel never touches steel in the mortars. Repairs are seldom necessary. The pitch of the amalgamating tables is extraordinarily steep—2 1-4 inches to the foot. The plates themselves are broken up into short sections. These features are necessary to keep the plates clean and to secure a maximum amalgamation. Below the tables a screen is placed to catch any coarse particles.

The mill practice has been evolved, of course, with reference to the heavy, sliming arsenical ores of Deloro. Experience has proved already that it is well adapted to Cobalt ores.

Water is fed to the mortars from the bottom, in line with the dies. This prevents banking and cogging and has proved very effective with the dead, inert ores treated.

The battery frames are constructed on lines of wonderful simplicity and strength. Roughly the elevation corresponds in shape to the letter A, which makes it self-contained. Vibration is minimized.

After leaving the plates the pulp is run through a mercury trap. Thence it goes to the first set of concentrators. The tailings from these are classified hydraulically, making three products, which in turn are treated separately. The combined concentrates are then subjected to the bromo-cyanide process. The tailings are led off in a launder and automatically sampled at the point where they leave the mill by a special sampling device, designed by Mr. Kirkegaard. The basic idea of this sampler is original. The flowing pulp is the motive

Manager's Residence and Company's Office.

Deloro Village.

force. Hence the speed varies according to flow. The samples, it is claimed, are always aliquot parts of the run. The sampler cuts 1-60th of the total pulp. It takes samples across stream at intervals of about 6 minutes.

In the cyanide plant the pipe system for handling the different solutions is ingeniously painted in different colors—red, white and blue—to obviate mistakes. To

General View Over Deloro Mine—Looking South.

Mr. S. Wright, who, with Professor S. F. Kirkpatrick, is associated with Mr. Kirkegaard, belongs the credit of this effective scheme.

While a detailed description of the cyanide plant is impossible just now, a few outstanding features may be noticed. In the large settling box, for instance, sheets of glass are used as settling plates, and the circulation of liquors is effected by direct acting pumps.

A commodious laboratory, detached from the other buildings, completes a square, the other three sides of which are formed by the stamp mill, cyanide plant and power house, all of which are also detached and independent.

The power house is an airy, well-lighted brick building. The 20 drill compound steam and single stage air Rand compressor has been sold to the Cobalt Central Mining Company. Its place will be supplied by a motor driven compressor. In addition to this there also is a smaller compressor, cross-compound steam and air, which is exclusively devoted to pumping from the mine.

Deloro Church.

The system is known as the Harris air-lift. It is capable of handling 500,000 gallons in 24 hours.

The installation of one 150 h.p. Weber suction gas producer is now complete. The order was filled by the Weber Gas Engine Company of Kansas City. This drives a 100 kilowatt alternating generator of the Bullock type. Power is transmitted 1,800 feet to the new Cobalt plant, where all machinery will be motor driven. Light will also be furnished from here for the whole plant.

For the stamp mill there is independent power. A 75 horse-power Robb-Armstrong high speed engine has given extraordinarily good srevice. The engine was guaranteed by its makers not to vary more than 2 per cent. So admirably governed is it that its speed varies well within this limit when two rock breakers (requiring 20 to 30 horse-power) are thrown off or on. This engine has had four continuous years of high speed mill service and has never required repairs. It certainly seems to demonstrate the suitability of a high speed engine for stamp mill work.

The concentrators are run by a separate small engine.

Within the limits of a short article it is quite out of the question to attempt to do more than merely indicate a number of the more striking facts of such a plant as that of the Deolro Mining & Reduction Company.

One is struck, on arriving at Deloro, by the neat houses of the workmen; the substantial offices; the attractive assembly hall, which is used for and adapted to both religious and social purposes; the tennis court; the manager's residence. All have an air of permanence and comfort.

Deloro Tennis Court.

As mentioned above, three men, Messrs. Kirkegaard, Kirkpatrick and Wright, all of them in their several branches exceedingly well qualified, conceived and carried out the scheme of establishing a metallurgical plant at Deloro.

They have evolved their methods with elaborate care. Mr. Kirkegaard brings to the work a rare mechanical genius and a lifetime of experience. Mr. Wright is a metallurgist, and chemist, of solid attainment and keen executive ability. Mr. Kirkpatrick has made a reputation already in the chair of Metallurgy at the Kingston School of Mining. With three such men at the helm there should be nothing to hamper the progress and growth of this new plant.

At the annual meeting of the Providence Mining Company, held recently at Greenwood, B.C., a resolution was passed authorizing the directors to issue $500,000 6 per cent. bonds, to enable sinking to be continued to the 1,000 foot level. The following gentlemen were elected to the Board of Directors: Messrs. M. F. Madden, F. Byrnes, M. S. Madden, O. V. O'Donnel, H. J. Fitzgerald, F. Rudolph, D. B. Scully, of Chicago, and W. S. Macy, of Phoenix.

RESCUE STATIONS IN GREAT BRITAIN.

In the issue of THE CANADIAN MINING JOURNAL for 15th April, 1907, the author gave a brief description of the various types of rescue apparatus in use in the Old World, and a few notes on the progress of rescue stations and rescue work in mines in Great Britain may not come amiss to the readers of this JOURNAL.

A large amount of interesting information was recently given to a Royal Commission by Mr. M. H. Habershon from experience obtained in the working of a joint rescue station at Tankersley, near Barnsley in the South Yorkshire coal field in England.

This station was erected in 1901 by three colliery companies, who between them worked in the neighborhood of twelve mines. The building of this station was largely in the nature of an experiment and was looked upon as of somewhat doubtful value by many mining men. The funds available were very limited, too limited in fact for any really effective work to be done, more especially in view of the fact that six years ago breathing apparatus were not the finished and effective devices they are today. The first apparatus obtained were the Giersberg helmets. These are now completely obsolete and never were of any real utility. Then several apparatus of the Shamrock type were obtained, and a Pneumatogen also. The latest addition to the station, and one that has given considerable satisfaction is the Draeger helmet apparatus.

Mr. Habershon gives some figures of tests made with the Draeger apparatus, which show that it is a really practical machine. One man wore the helmet for four hours and three minutes, doing no work during this time. Another man wore it for five hours and walked 7,400 yards during that period. At the conclusion of the test has was very hungry, which it is said is the most noticeable effect of wearing the apparatus for any long period of time. This same man raised a 56 pound weight to a height of seven feet 610 times in one hour and forty minutes, which is equal to 239,120 foot pounds of work.

The more important points brought out by Mr. Habershon in his evidence as the result of his six years' experience are summed up in the following:—

All men are not constitutionally suitable to be trained to wear breathing apparatus, and it is not a matter that can be mixed with ordinary ambulance training.

Apparatus of this kind is worse than useless, and is in fact a veritable death trap unless it is under the charge of a trained man and kept in constant and perfect readiness for instant use.

Mr. Habershon is opposed to apparatus being kept at separate collieries where it might not be properly overhauled periodically, but thinks it is essential where a group of collieries is to be served to have a central rescue station in charge of a thoroughly competent man. He states that the number of really competent men of this kind could be counted on the fingers of one hand in England to-day.

From the remarks made by Mr. Habershon he appears to have no doubt that the best and most practical apparatus is the Draeger, and he prefers the helmet to the mouthpiece.

A complete justification of the expenditure involved and of Mr. Habershon's remarks as to the value of a central rescue station has just been given by an underground fire that occurred on the 15th of October this year at the Wharncliffe Silkstone Collieries. It was to the initiative of the managing director of these collieries, Mr. Geo. Blake Walker, that this station really owed its origin, and it is singular that the first really effective use of breathing apparatus in dangerous underground conditions in England should have occured at this colliery. The fire in question originated in an electrical engine house about one mile and a half from the pit bottom. It was impossible to approach the seat of the fire in consequence of the pungent fumes, and word was sent to the rescue station, where in a very short time three of the officials were fitted with the Draeger helmet and proceeded to the engine house. They had a hard and a hot time, but succeeded in extinguishing the fire after an hour and a half's works. The Wharncliffe Silkstone Colliery Company work six seams, which are all connected by means of stone drifts and shafts, so that a fire in one seam would in time have involved the whole mine, and it would have been a very difficult matter to seal such a mine. The confidence of the men who put out this fire in the efficacy of their apparatus is shown by the fact that after all the men had been withdrawn from the two seams immediately involved the three of them proceeded a mile and a half from the pit bottom clad in these helmets as their sole protection from suffocation. Such confidence can only be obtained by constant practice, and the knowledge that the man who was responsible for the condition of the apparatus knew his business and was to be trusted in a time of emergency.

Another proof of the efficacy of these apparatus in saving human life was recently given at the Saar and Mosel Colliery at Merlbach in the Saar district of Germany. An explosion occurred and immediately afterwards a party of twelve men descended. After an hour's work they brought the survivors safely to bank, eight in number, and also salved the bodies of four men whom the explosion had killed. This makes a total of about 50 lives which have now been saved by the use of the Draeger apparatus.

Although primarily these breathing apparatus were designed with a view to saving life after explosions, yet it is possible that their greatest practical utility is in fighting underground fires. Like all fires, those that start in a mine are small affairs at first, but although they do not really increase so rapidly as fires on the surface, they are much more difficult to approach, because of the confined area and the restricted ventilation. The breathing apparatus enables men to approach and extinguish an underground fire in its incipient stage. One fire thus averted will repay many times the initial outlay for material and training and as remarked once before in the columns of the JOURNAL, no colliery company that values the lives of its men and the property of its shareholders can afford to ignore the provision of apparatus of this kind.

F. W. GRAY.

The Le Roi Company is to be very heartily congratulated on securing the services of so able a metallurgist as Mr. Thomas Kiddie to take charge of operations at its Northport smelter. Mr. Kiddie has made a notable success of smelting on the coast, especially in connection with the operation of the Tyee Copper Company's works at Ladysmith, which were designed and erected under his direction. He has lately acted as manager of the Hadley smelter, Prince of Wales Island. Mr. Kiddie, it is understood, will enter upon his new duties on December 1st.

MONAZITE AND ZIRCON.

(Advance chapter from "Mineral Resources of the United States," 1906.)

By Douglas B. Sterrett.

Introduction.

The demand for thorium for the manufacture of Welsbach and other forms of incandescent gas mantles has increased yearly, and until some other invention takes place of these mantles this demand will continue. Improvements are made from time to time in the manufacture of gas mantles, and two new inventions with this object in view have been reported—one in use in Germany, the other in England. The German mantle uses a form of copper cellulose impregnated with the proper salts; the English mantle is made more durable by adding an ingredient called "laddite" to the thorium and cerium solution in which the mantle is dipped. It is said that the latter mantle has not been injured after burning 2,500 hours.[1]

The minerals from which thorium and the other rare metals used in the manufacture of gas mantles are obtained are monazite, thorianite, and thorite. The bulk of the supply of thorium is obtained from monazite, which is essentially an anhydrous phosphate of cerium, lanthanum, and idymium, containing a small and variable percentage of thorium. Though occasionally found in crystals and masses of many pounds weight, the source of the commercial material is in the form of sand. The grains are opaque to translucent and sometimes transparent, and they vary from light yellow to reddish yellow to brownish in color. They also sometimes slightly greenish. The freshly broken or unaltered mineral has a resinous luster. This luster is brilliant, especially on the cleavage faces. The mineral is brittle and has a hardness of 5 to 5.5. It can readily be crushed between the teeth and yields a soft grit, quite distinct from the harder minerals sometimes mistaken for it. The specific gravity varies from 4.9 to 5.3, and is mostly over 5.

Thorite is a silicate of thorium, theoretically containing 81.5 per cent. of thoria, though practically it generally carries less than 70 per cent. Thorianite is an oxide of tohrium containing uranium and the metals of the cerium group, and carries from 70 to 80 per cent. of thoria. These two minerals have been obtained in commercial quantity only in Ceylon.

Monazite.

North Carolina, South Carolina, and Georgia.

Location and Occurrence.

The area in which workable deposits of monazite have been found in the Carolinas is growing yearly, especially to the southwest in South Carolina, where parts of Laurens, Pickens, Anderson, and Oconee countries are now included. This extends the belt in which deposits of comemrcial value are known to exist nearly to the Georgia line. To the northeast the belt has been extended beyond the limit set for it in southern Caldwell and northern Catawba countries into northern Iredell County, and will doubtless be traced farther. This area contains upwards of 3,000 square miles, and includes part of all of Iredell, Caldwell, Catawba, Burke, and Polk countries in North Carolina, and Cherokee, Laurens, Spartanburg, Greenville, Pickens, Anderson, and Oconee countries in South Carolina.

Monazite has been found at other places outside of this area, but as yet no workable deposits have been developed. Thus Nitze[2] mentions the finding of monazite in Hall County, Ga., near The Glades, on the north side of Chattahoochee River, about 10 miles northeast of Gainesville, where it occurs in the gold placers of Flat Creek and its tributaries, the Glade, Stockeneter, Hamilton, and Huram branches.

A prospect in the extreme northeast corner of Georgia, in Rabun County, is being investigated at the present time for its values in monazite and gold. Through the courtesy of the party interested in the property the writer has learned that the concentrates assay over 5½ ounces of gold per ton, with 30 per cent. of cerium oxide and 4 per cent. of thorium oxide. Since such a high content of cerium would correspond to nearly pure monazite, carrying no other minerals such as are generally found in concentrates, the oxide of lanthanum and didymium were probably included in that report for cerium. In that case the concentrates would run a little over 40 per cent. monazite if the rare earth oxides found by assay all came from monazite. If the percentage of concentrates that can be washed from the gravel is large, such a deposit is very promising.

Among other places, monazite is reported to occur in some quantity at a few localities in Clay County, N. C. At Wilkesboro, N. C., a small quantity of monazite was found in a trial panning in Cub Creek. The area of known commercial deposits of monazite will doubtless be extended both to the northeast and to the southwest as the demands for monazite increase and the old deposits become exhausted.

The greater part of the monazite belt lies in the Piedmont Plateau. The belt crosses the South Mountain, however, in Burke, McDowell, and Rutherford counties, and borders on the foothills of the Blue Ridge. In the monazite region the elevations of the Piedmont Plateau vary from 700 to 800 feet to 1,500 feet above sea level. Much of this area is dissected by river and creek valleys from 50 to 300 or 400 feet deep.

Workable deposits of monazite do not occur everywhere in the monazite belt as described, but are confined to certain smaller belts whose direction and extent are controlled by the trend and continuity of certain rock formations from which are derived the deposits found chiefly in the gravels and sands of creek and stream beds and adjoining bottom lands. Gravel deposits may be too low grade to work on the upper part of a stream, while lower down, where the area drained contains favorable rock formations, the gravels may be rich. Hence for successful prospecting a general knowledge of the geological formations and ability to recognize those from which the monazite of the placers is derived is desirable.

Geology.

Classes of rocks.—Practically all of the rocks of the monazite region are either gneisses or schists.[3] The most important formation includes both of these types and is called Carolina gneiss. Other rock formations are gneissoid and porphyritic granite, hornblende gneiss

and diorite, pegmatite, peridotite and allied rocks, and diabase.

The Carolina gneiss is by far the most extensive formation in the monazite region and appears in nearly every section. The granite-gneiss rocks are next in importance and occur in belts and irregular shaped masses throughout the area of the Carolina gneiss. These granite masses vary from small dikes measured in feet or inches in thickness to large bodies 3 or 4 miles across. After the granites comes the hornblende gneisses, which are most prominent along the northwest side of the region, where they are generally associated with large granite masses. Hornblende gneisses occur in other portions of the monazite belt, but are not of so much importance. The Carolina gneiss presents considerable variations in composition and structure. The most common types are mica, garnet, cyanite, and graphite gneisses and schists, or combinations of two or more of these types. These rocks vary from light gray to dark gray in color and often have a light bluish-gray to bluish-black cast when graphite is abundant in them. Some of the schists are fine grained and are often composed of several distinguishing minerals, as muscovite, biotite, cyanite in fine needles, and graphite, besides fine grains of quartz and other minerals; others are composed of the same minerals in coarser grains or flakes. Garnets appear in each rock type and may be faily large even in the finer grained schist. The presence of much pegmatitic material is a characteristic feature of the Carolina gneiss.

The granite gneisses are either biotitic, muscovitic, or hornblendic in composition, and in places have a typically porphyritic texture. In the latter case the feldspar phenocrysts generally assume an augen form, caused by crushing and elongation in the direction of shearing. There is an abundant development of small red garnets throughout many large areas of these granites. A microscopic section cut from a porphyritic granite forming the bed rock at the Moon mine, 9 miles east of south of Greenville, S. C., contained the following minerals: Microcline, orthoclase, albite, quartz, biotite, muscovite, garnet, and a little zircon. The rock showed the effects of shearing, with the development of introduction of secondary minerals. The feldspar phenocrysts had been fractured and elongated, and secondary quartz had been deposited between the fragments. As a result of these metamorphic processes the feldspar crystals form augen-shaped bodies which lie parallel to the schistosity of the rock mass. The garnet is plainly secondary, and contains considerable quartz intergrown and included with in it. In other parts of the region, as in the Carpenters Knob section and much of Cleveland County, N. C., there are large areas of granite gneiss which have an even granular texture and are composed chiefly of white feldspar, gray quartz, biotite, muscovite, and garnet.

The hornblende gneisses and diorites are the only other types of rock of much importance in the monazite region. The hornblende gneisses are nearly black to dark green in color, and are composed chiefly of small interwoven and matted hornblende crystals. They grade into diorite, which is also dark colored but contains a noticeable amount of feldspar and has a granitoid texture. These hornblendic rocks are more prominent throughout the northwestern side of the monazite belt, where, along with large areas of granite, they assume considerable importance.

Pegmatite is of common occurrence throughout the region, especially in those areas where commercial deposits of monazite are found. There is a wide variation in the nature of this pegmatite. In some places it occurs as distinct masses or bodies with the typical composition and texture—that is, composed of quartz and feldspar, with or without mica and other accessory minerals, crystallized out on a large scale. In other places the pegmatite represents a re-crystallization of portions of rock formations with the formation or introduction of the component minerals of pegmatite. Sometimes the secondary minerals consist chiefly of quartz with smaller quantities of the others. Often it is difficult to determine whether certain smaller rock masses are granite or pegmatite, when the texture is not very coarse and the relations to the inclosing rocks can be clearly seen in the small portions exposed.

The peridotites are not of very common occurrence in this region. They are dark green to greenish-black basic rocks, containing the ferromagnesian minerals olivine, pyroxene, and sometimes hornblende as their chief constituents. The peridotites often outcrop prominently and generally leave rounded, "nigger-head" bowlders on the surface near their outcrop. In the majority of cases, however, the peridotites will be found to have partly altered to soapstone or serpentine at the surface. In some cases the whole mass has been thus metamorphosed.

Diabase is not uncommon in certain parts of the monazite region, and is readily recognized by its dark color, weight, and the characteristic spheroidal of "nigger-head" bowlders it leaves scattered over the surface.

Age.—Most of the gneisses and schists of the monazite region are of great age and represent highly metamorphosed sedimentary and igneous rocks. The metamorphism, folding, and faulting of these rocks have been extreme, and in most cases it is difficult to determine the original nature of the formations, since much of the sedimentary bedding and igneous texture has been destroyed by mashing and re-crystallization. This is especially true of the Carolina gneiss, which is the oldest formation represented and has been cut by instrusions of later age. The hornblende gneiss and diorite, the peridotite, and part, at least, of the granite-gneiss are also very old rocks and are intermingled and folded with the parts of the Carolina gneiss in a very complex way. Other gneisses and granites are of later age and have not been subjected to the same degree of shearing as the older ones, so that the development of schistosity in them has not been so extensive as in the older types. The gneisses and schists, particularly of the Carolina gneiss, having been interbanded with an cut at all angles by numerous streaks of pegmatitic or granite material. These streaks range from a fraction of an inch upward in thickness. In some places pegmatization is so thorough that mica has become strikingly like granite gneiss.

Associations of monazite.—The best deposits of monazite have been found in or near areas where large granite masses outcrop or where pegmatization of the country rock has been extreme. On the other hand, where the gneisses and schists are nearly free from pegmatitic material and there are no granite masses in the neighborhood the stream gravels are found to be very poor in monazite. When monazite has been found in place to any extent in the country rock it has not been in the ordinary pegmatite streaks and masses, but in portions of the rock formations where there has been extensive re-crystallization, with the development or introduction of pegmatitic material. Such pegmatization is locally a common feature of the Carolina gneiss, which is accordingly a favorable kind of rock for the occurrence of monazite.

Monazite deposits in regions where hornblende rocks are abundant generally contain a large percentage of black sand. In such cases it is often difficult to concentrate the monazite to a marketable grade. As an offset to this, however, especially in regions where granite is associated with the hornblende rocks, gold is often found in the concentrates in more than sufficient quantity to pay the cost of separation, and in some localities the concentrates generally carry also a quantity of zircon sufficient in some cases to pay for separation. This zircon is in the form of small clear crystals with a brilliant luster, which range in size up to 1 millimeter square and about 2 millimeters long. A fairly clean separation can be made by cleaning with an electromagnetic machine and careful washing. The quantity and the size of the zircon crystals found in the monazite concentrates are in general smaller in the deposits located in areas of Carolina gneiss than in the granitic and hornblende rock; likewise the quantity of gold found in the deposits in areas of Carolina gneiss is smaller and rarely pays the cost of separation.

Weathering and soils.—The rocks of this region have undergone such extensive weathering that good outcrops are the exception, and a thick mantle of residual soil covers much of the country. The kind of rock underlying certain soils can be determined, unless decomposition has been too thorough, by studying the outcrops and the gradations from such exposures into the residual soil. Thus the nature of the soils furnishes a clew as to the probability of monazite being present in quantity in the gravel of the streams; and, conversely, the nature of the country rock that a stream drains can often be told and the probable occurrence of monazite be conjectured by examining the debris in the gravels of the bottom lands and of the stream bed.

The Carolina gneiss, on partial disintegration and decomposition, often forms a gravelly soil with red clayey matrix. This is especially characteristic of the graphite-cyanite type, which is abundant in parts of the region. The pebbles are composed of small fragments of the original rock, often tufts of cyanite, impregnated with hematite or limonite, or small pieces of pure iron ore.

Garnets may or may not be present. On more complete decomposition a reddish clayey soil results, with no decided characteristics. Other types of the Carolina gneiss, in which mica is an important constituent, leaves a micaceous soil which often assumes a purplish color. Granites, on partial disintegration and decomposition, yield light sandy soils. Often blocks of undisintegrated granite occur scattered through the soils, giving additional evidence of the nature of the underlying rocks. On more complete decomposition granite yields soils of a light to dark reddish color, depending on the quantity of ferromagnesian minerals in the original rock, as biotite or hornblende. The quartz grains of the granite remain as sand mixed through a clayey matrix. Where the Carolina gneiss and granite are intimately associated, or where pegmatization has been extensive in a body of Carolina gneiss, there results a sandy soil, characteristic of granite, containing scattered through it pebbles of iron ore, characteristic of the Carolina gneiss. The relative importance of the iron-ore pebbles decreases in the soils as the quantity of pegmatite or of granite in the rock formations increases. These features of the soils are especially marked on the broad flat ridges characterizing much of the Piedmont Plateau. The hornblende rocks yield a dark reddish-brown to chocolate-colored clayey soil which is very characteristic.

Mining and Cleaning.

Wet concentration.—Nearly all of the monazite shipped from the Carolinas has been obtained from gravel deposits. These deposits lie in and along the stream and creek beds, where the monazite has collected after liberation from the decomposing gneisses and schists of the region. A part of the production for 1906, however, was obtained from a monazite-bearing gneisses rock by crushing and then separating on concentrating tables. The percentage of monazite contained in the ore treated in either type of deposit is small and probably does not often run over 1 per cent.

The usual method of working the gravel deposits has been washing in sluice boxes, though in 1906 concentrating tables were employed at several places. The form of table most used in the Wilfley or one of similar type. It is set up at the mine as convenient as possible to the gravel deposit to be treated, and is operated by a gasoline or kerosene motor. The gravel is dumped into a shaking hopper through which water is continually passing. The sand is washed through the hopper and passes over the table, while the oversize is shoveled out. At one mine the gravels are raised by a mechanical elevator and the oversize is removed in a revolving screen, from which the sand is passed over a table. In the better class of machines a number-one product can be taken off in the first washing, and the middlings be passed over a second time along with new sands. In some cases, however, where only two grades are separated, concentrates and tailings, a considerable quantity of rough concentrates is first washed out and then carefully sent over the machine a second time. In this way the grade of the sand is raised, and a very clean product is obtained.

The degree of concentration it is possible to attain by wet methods depends largely upon the composition of the gravels to be treated and the care used in treating them. Where black sands, such as magnetite, ilmenite, etc., and other minerals with a high specific gravity are abundant it is difficult to bring the concentrates up to 50 per cent. monazite, even with good concentrating tables, and the product from sluice boxes may run as low as 15 per cent. and under. In more favorable deposits, where the percentage of black sand is not large, a concentrate running 80 or even 90 per cent. can be obtained with concentrating tables, while in sluice-box washing the grade can be brought up to 70 or even 80 per cent. Where the monazite is separated from the hard rock formations the grade has been brought up to 95 per cent. and over by the use of concentrating tables. Taking the monazite region as a whole, there are not many large gravel deposits which will yield concentrates of over 40 per cent. monazite in sluice-box concentration, and the average yield of crude monazite would probably not be far from 30 per cent. Should the use of concentrating tables increase the grade of the crude monazite produced will be raised correspondingly.

Formerly the deposits of monazite-bearing gravels in the bottom lands along the creeks and streams were worked without any thought of the land being left in such a condition that farming could be resumed after mining had ceased. So the soils were washed away, and the gravels were piled up in irregular heaps and ridges . In this way the best farming lands were being ruined, and those farmers who had leased their monazite deposits found themselves possessors of nearly worthless land, with only money received on the leases. This has been remedied in many cases by more systematic working of the gravel beds. The top soil is thrown on the side of the working pit opposite to that on which the deposit

lies, and the underlying gravel is washed. When the next block of gravel is opened the soil is thrown off upon the gravel already washed in the adjoining pit. By spreading the gravel out somewhat evenly and placing the soils smoothly over it nearly the whole land is kept in condition for farming after the monazite has been removed.

It has been found that, when the stream gravels are washed for monazite and then left for a few months, especially in rainy weather, another crop, so to speak, of monazite can be obtained. This results from the washing in of monazite from the surface of the surrounding fields and hills, where it has been left by the decomposition of the original rock matrix. With this end in view, the lands draining into the streams should be plowed now and then, to give the surface waters a chance to wash the monazite into the stream beds. In many cases the farmers have preferred to wash the stream gravels themselves once or twice, or more times, a year. The usual cultivation of their farm land keeps a fresh supply of monazite stirred up in the fields, from which much of it is washed into the creeks.

Electrical cleaning.—A portion of the crude monazite is shipped to the manufacturers as it comes from the mines. The greater part, however, is cleaned by electrical machinery at local cleaning mills in the monazite region. In this way the percentage of monazite in the sand is greatly increased and the freight charges on waste products are minimized. The different types of machinery in use are (1) the Wetherill electro-magnetic machine and its modifications, (2) a machine in which the minerals are deflected by electro-magnets while falling, and (3) a static machine.

Of the Wetherill machines there are two specially designed, improved types operated in different parts of the region—one in North Carolina, the other in South Carolina. In these machines there are four magnetic fields, which lift the different varieties of sand from a main conveying belt passing through them. Smaller belts, between the main belt and the magnetic pole lifting the minerals, carry the sand attracted by the different magnets out of the magnetic field and drop it into proper receptacles. In this way magnetic iron is removed by the first field; titanic iron, garnet, and other minerals of similar magnetic intensity by the second; and coarse and fine monazite by the third and fourth fields, respectively. Quartz, rutile, zircon, gold, and other highly nonmagnetic minerals pass off as tailings. This type of machine readily cleans the sand to 90 per cent., and is able to raise it to 95 per cent. monazite by careful handling. In another type of the Wetherill machine, of which several have been used in the monazite region, there is but one magnetic field, which generally removes magnetic and titanic iron and garnet, while the monazite is left with the quartz, zircon, and other highly non-magnetic minerals. The cleaned product from this machine probably averages about 80 per cent. and does not often run over 85 per cent. monazite. When the field magnets are properly constructed it is possible to pass the sand through the machine a second time under a much higher magnetic intensity and to free the monazite of many of the other minerals left with it in the first cleaning.

In the second type of the electro-magnetic machine the sand is passed over a series of belts, and the separation is affected by the deflection in a magnetic field of the grains of mineral as they fall over the ends of the belts. The different minerals are drawn out of their ordinary course of fall by powerful magnetic fields and are carried off in different chutes. In this way a very clean separation of monazite is said to be effected.

In the electro-static machine all the minerals but monazite and garnet are lifted from the sands. This is accomplished by a cylinder about 2 feet in diameter and 3 feet long, covered with sheets of vulcanite, slightly separated from one another, 8 by 12 inches square and three-eighths of an inch thick. The vulcanite is excited by rubbing with felt-covered cylinders revolving at a high rate of speed. The speed is regulated by cone pulleys, and is made greater when the atmosphere contains considerable moisture. The sand is heated by two gasoline lamps before exposure to the electrified cylinder. The latter is revolved slowly, and all the sand attracted to it is removed by brushes.

Monazite in Original Matrix.

(New Company and Plant.)

A new company entered the Carolina monazite field during 1906. This was the British Monazite Company, representing the South Metropolitan Gas Light Company of London, which undertook to mine monazite to secure a source of supply that could be depended on at times when the selling price of thorium products becomes excessive, or the supply in the market is limited by monopolies. The new company located about 3 miles northeast of Shelby, N.C., where it has opened the old Campbell mine with improved machinery and methods. The proposition at this mine is different from that of any other mine being operated in the region, and consists in crushing a monazite-bearing rock and separating out the monazite with concentrating tables. For this purpose a frame-work mill, well designed for the placing of the machinery used in treating the ore, was built adjacent to the outcrop of the ore body. Through the courtsey of Mr. Hugh Stewart, manager for the company, the following outline of the operation is given:

From the quarry the ore rock is trammed to the mill and dumped on the feed floor whence it receives the following treatment:

1. Crushed in Gates gyratory crushers to 1 inch.
2. Elevated to bin, whence it is discharged to rolls crushing to one-sixth inch diameter.
3. Product from the latter is discharged into sizing apparatus (sieves). Material of one-fourth inch diameter or under goes through sieve and is discharged into second elevator. Material over one-fourth inch, goes over sieve and is discharged into second crushing rolls, where it is reduced to one-eighth inch and is also discharged to second elevator.
4. Second elevator sends ore into Huntingdon mills, fitted with 16-mesh screens, through which the ore is discharged.
5. Ore from the Huntington mills is collected in hoppers and fed to 1 Wilfley and 3 Overstrom tables. The seconds and thirds from the first Wilfley and middlings from the Overstrom are passed over second Wilfley table for final concentration.

(To be continued.)

HARVEY GRAHAM.

There died on Thanksgiving Day a man whose strong purpose and manful accomplishment meant very much to Nova Scotia.

Harvey Graham breathed his last at his home in New Glasgow, on October 31st, 1907.

Mr. Graham was born fifty-nine years ago in Little Harbor, County of Pictou, Nova Scotia. In New Glasgow he was educated and there he spent the early years of manhood. His first wife, Miss Hannah Fraser, was a New Glasgow lady. His second wife, a daughter of the late Alexander McKay, of North Sydney, died last August, while her husband was on his way home from Brazil.

Mr. Graham was successively manager of the Nova Scotia Glass Company, manager of the Black Diamond

Coal Company, and manager of the New Glasgow Iron, Coal & Railway Company. The last position he filled until the New Glasgow Company was absorbed by the Nova Scotia Steel & Coal Company. For several years before his death he filled the offices of director and assistant general manager of the Nova Scotia Steel & Coal Company. In these joint capacities Mr. Graham gave evidence of the stability and calm, deep strength of his character.

As a Nova Scotian and as a Canadian Mr. Graham always identified himself with progress and reform. He was an ardent, though not a bitter, advocate of temperance. He, himself, was an exemplar of true temperance—the temperance of a sound mind in a sound body.

The death of such a man is an event of sad moment to any community.

TANTALUM.

The fruitful activity in experimental metallurgic work during recent years for both scientific and commercial purposes, especially in electro-metallurgy, has made possible the reduction of metals that were before unutilized and almost unknown. The determination of the properties of these metals has suggested uses for them, with the result that there is a growing demand for ores that but a few years ago were sought only as mineral curiosities.

One of the most remarkable of these metals is tantalum. It is not attacked by hydrochloric, nitric, or alkaline solutions. It can be drawn into fine wire having a tensile strength greater than soft steel. A red-hot lump of tantalum may be at once hammered into a plate which, on repeated rehammering, becomes as hard as diamond. A diamond drill running continuously for three days at 5,000 revolutions a minute failed to penetrate such a plate, although it was but 1 millimeter thick, while the drill was much worn.

A British patent has been obtained for making writing pens from tantalum, whose hardness, elasticity, and resistance to corrosion would seem to fit it well for such use.

Tantalum is now employed principally as a filament in an electric incandescent lamp which was put on the American market in 1906. This lamp consumes but two watts per candle power, as against more than three watts per candle power for the ordinary carbon filament lamp.

The principal ores of tantalum are tantalite and columbite (a combination of iron, tantalum, and columbium), which occur in pegmatites, or coarse granites. In the United States tantalum ore may be found probably in the greatest quantity in the Black Hills of South Dakota. In 1906 one mass weighing 600 pounds was discovered. A small lot was shipped to Germany from Canyon, Colo., during the year, and small shipments have also been made from Mitchell County, N. C.

MOLYBDENUM IN 1906.

The only production of molybdenum reported to the United States Geological Survey for 1906 was from Homestake, Mont., but deposits at Dillon, Sheridan, Ophir, and other places in the same State are being prospected. Ores of this metal are found also in Maine, Washington, Oregon, California, Nevada, Utah, Arizona, New Mexico, and Colorado.

The ores are molybdenite (molybdenum sulphide) and wulfenite (lead molybdate). Molybdenite is much the more common, but most deposits are too small to justify expensive machinery and the demand is at present comparatively small. Wulfenite is more easily saved, but often carries so many impurities that it is almost impossible to use it.

The metal is employed as an alloy of steel, and, in the form of ammonium molybdate, to determine the presence of phosphorus in iron. In Europe ammonium molybdate is utilized as a fireproofing material and as a disinfectant for cloth used in railway passenger coaches and for other similar purposes. It is said to be a powerful germicide. Molybdenum salts give a fine blue color to pottery glaze. The uncertainty of the supply of this metal has probably prevented its more extensive use in steel, in which it has nearly the same effects as tungsten, even when added in a much smaller quantity. Efforts to use metallic molybdenum as a filament for incandescent electric lights have been unsuccessful, owing to its comparatively low melting point.

ENGLAND'S PREMIER COBALT MINING COMPANY.

With the permission and approval of the persons concerned we reproduce herewith a letter, written by a prominent mining engineer, in answer to enquiries about England's Premier Cobalt Mining Company.

We understand that action is being brought against this mining company by purchasers of its stock in England. Its claims are dealt with briefly and pointedly by the following letter. There is little need for us to enlarge upon it.

My Dear Sir,—

I have your letter of the 5th inst. enclosing prospectus of England's Premier Cobalt Mining Company, Limited, in which you state that the company which you represent have subscribed for shares in the said mining company, and ask me to examine and criticize some of the statements contained therein, which I take pleasure in doing so far as statement does not apply to the merits of the mine itself, of which I have no knowledge.

In the prospectus you have numbered the various paragraphs, and I will discuss them by the numbers as designated by you.

Paragraph No. 2 states that the property is in the heart of the Cobalt silver mining camp, and adjoins the Steindler, Edison, Evans and other mines, and is in close proximity to the Buffalo, Silver Queen and Hudsoy Bay properties. This property does not adjoint either the Edison or Evans mines, and is not in the heart of the Cobalt district, and with the exception of the Evans property, is more than three (3) miles from any shipping mine.

Paragraph No. 3.—The Evans mine is principally valuable for its cobalt, and their ore does not run high in silver.

Paragraph No. 4.—The Portage Bay district is at present an entirely unknown quantity, and with the exception of possibly the Evans mine, does not at present contain any paying mines.

Paragraph No. 5.—The Edison property is being mined solely for the cobalt values in the interest of Mr. Thomas A. Edison, who needs cobalt for electrical purposes. The Portage Bay district is not experiencing a boom, nor is there any reason for thinking at present that much of the best shipping ore will come therefrom.

Paragraph No. 7.—As to the formation. The report of Mr. Foster, contained in prospectus, shows that the formation is diabase and gabbro. The ore-bearing formation on the "Nipissing" is neither of these.

Paragraph No. 8.—Although rich values have been found at depth in some instances, it does not necessarily follow that rich ore will be found by sinking if it is not found at the surface. The entire surface of the Cobalt district has been planed down by glacial erosion, and surface prospecting, for that reason, is much cheaper than prospecting by sinking. Therefore, unless surface showings of value can be obtained, there is no especial reason for prospecting to depth.

Paragraph No. 10.—The Trethewey mine is not down over 300 feet, but the extreme depth is 120 feet. Values have not increased either in the Trethewey or La Rose mines (nor Drummond mine) with depth. All of these mines had exceedingly rich ore on the surface, and the owners will be perfectly satisfied if values remain the same at depth.

Paragraph No. 11.—Many of the mines in the district are shipping ore containing less than 100 ounces of silver per ton.

Paragraph No. 12.—Although it is necessary that a claim be passed by a mining inspector before lease is issued, it does not prove that this inspection is evidence of value sufficient to yield profit. They simply require that a well-defined vein giving possibility of profit be exposed. This is one of the commonest arguments used to prove that a claim is of value, but it signifies nothing from the commercial standpoint. Inspectors have been especially lenient in the Portage Bay district, because it is a new district and they desire to encourage prospecting as much as possible.

Paragraph No. 13.—Prospectus mentions that two (2) shafts have been sunk, but does not give their depth. This is exceedingly indefinite. Nor does the prospectus state the width of ore streaks which are claimed to have shown values from 321 to 900 ounces silver per ton. If these assays were made of small specimens, they are of no special use.

Paragraph No. 14.—There is no reason given in the prospectus for assuming that dividends may be confidently expected during the present summer.

Paragraph No. 16.—Prospectus states that on adjoining property (presumably the "Evans") average assays show over 3,000 ounces of silver per ton. This is not true.

The Cobalt district is a great mining district, and will be an important element in the production of silver. The district is now producing at the rate of about 1,000,000 ounces of silver per month, which is an excellent showing considering the short time the district has been in operation. During the past few months considerable deep exploration has been made, which in many cases tends to prove the strength of the veins, and the fact that in some instances rich ore is found at considerable depth.

The great success of some of the mines has stimulated the flotation of mining companies on ground of little value. In this, as in all other mining districts, there are rich and poor mines. All ground is not necessarily valuable, and unless there is evidence in the form of rich ore there is no reason why high prices should be asked for unexplored territory.

LONDON LETTER.

A Diamond Trust.

ALEX. GRAY.

A "corner" in diamonds is projected by the dominant factors in the DeBeers Consolidated and Premier Mines of South Africa. Conferences are taking place and the result is of greatest moment to the mining and monied worlds—to say nothing of the cutting trades of Amsterdam and Antwerp, and all who trim themselves with precious gems. Those who want diamonds will doubtless have to stretch their purse strings.

Details of the working agreement between these diamond producers are impossible of ascertainment; and they will so continue to the uninitiated laity. Primarily the object is to regulate the supply, but in reality the arrangement is an expansion of the Cecil Rhodes plan whereby diamonds could be won and distributed through

a central organization whose dictum is final—at least until rival mines are discovered. The Rhodes idea has proved its efficacy in practice. Its evolution has been one of the most thrilling chapters in the story of latter-day mining. If Canadians are to follow their fancy for "blue whites," "Cape whites," "Canaries" or better class "stuff," as it is characterized by the trade, they either will have to pay tribute to the contemplated clearing house or find a few mines of their own. That there are diamond mines on your side of the water is an undisputed fact. Whether those mines are payable is another matter, yet the doubt will never be removed by those of Kentucky and elsewhere who prefer rotary presses for printing scrips in bulk to "rotaries" for washing their diamantiferous ground in quantity. Diamond bearing mines need not necessarily be confined to South Africa. Whether at Hudson Bay territory, Iceland, or the "Blue Grass" country, the associated minerals noted offer opportunity for legitimate exploitation; so the prospective advance in diamonds may induce trans-Atlantic mining men to closely investigate their own fields. Then the South African combination will revise their visiting lists.

For thirty years or thereabout, the diamond-laden craters of Kimberley have yielded gems of "purest ray serene." More recently the Orange River and Transvaal colonies have contributed in varying quantity and quality. The "Diamond Syndicate," of which the pending proposal is an extension designed to assort and sell the diamonds, was contemporaneous with the amalgamation of controlling forces in DeBeers, Kimberley, Wesselton, Bultfontein, DuToitspan and Jagersfontein, constituting the basis of DeBeers Consolidated. Instead of individuals and smaller concerns holding and working claims to more or less disadvantage in these respective mines and forcing their diamonds on to indifferent markets at 18s., 19s. and 20s. per carat, as was the case twenty years ago, Rhodes, Barnato, Wernher, Beit & Company; Rothschild, Ponges, and others, took the DeBeers outputs month by month, or week by week, at contract prices. With minor changes in the personnel of this combination, the syndicate has since so preserved their diamond markets that to-day an average of 70s. per carat is realized. It has cost the public well on to a round hundred millions sterling to bedeck those who will have diamonds, and notwithstanding forebodings lest the supply exceed the popular demand, the annual output has attained a value of about £10,000,000 from South Africa alone. At one time Rhodes thought the world's yearly absorption of diamonds might justify finding £4,000,000 worth. That was when the per carat value was a sovereign and a Cape tax was imminent. Either Rhodes under-estimated the prowess of himself and colleagues or he did not comprehend the persuasive eloquence of American womankind, for his own creation has exceeded his estimate for a twelvemonth by putting out £5,000,000 to £6,000,000 worth. In twenty years the five Kimberley mines have accounted for about 43,000,000 carats, valued at about £70,000,000, to say-nothing of Jagersfontein, the stones from which are also controlled by the Diamond Syndicate, their quality being superfine. If you add the syndicate's profit, and the jeweller's profit, to the £70,000,000 valuation before the diamonds left Kimberley, the calculation that it has cost the public a hundred millions sterling to adorn the fair sex is not wide of the mark. Really these diamonds have been excellent investments. To comprehend this it is necessary only to state that the selling price of DeBeers diamonds has advanced 50 per cent. in the past eighteen months. Those who possessed jewels at previous prices have corresponding consolation.

Until the discovery of the Premier Mine near Pretoria in the Transvaal, the syndicate operating to such advantage in DeBeers diamonds had a free market, easily manipulated; because one or two small producers elsewhere, and alluvial areas on the Vaal River were negligible quantities. The Premier Mine is as large as the combined DeBeers "pipes," and when it demonstrated that its yield was a matter of machinery, the DeBeers Syndicate foresaw difficulties in their markets. Since all mines have low quality diamonds, and the Premier Mine has more of these than others, the mutual plan is to pool everything and uphold selling prices. The technique of diamond dealing is so complicated that a few perfect stones are certain to turn a loss on an average "parcel" into a profit. Consequently it has been accepted by all parties that 200,000 carats per month of Premier Mine diamonds, worth 25s. to 30s. are a menace to choicer asosrtments taken from the mines of Kimberley and Jagersfontein.

Rather than try conclusions with the Premier Mine product—some of which is unexcelled in quality—and precipitate a conflict that would adversely affect the general quality as taken from the DeBeers mines, the Diamond Syndicate consented to the pending negotiations. Obviously the public will "pay the piper," but what does it matter if the diamantiferous contents of craters in payable quantities are confined to South Africa? Not all diamond "pipes" are to be worked profitably. There are "blind" and low grade "pipes," just as there are barren or unpayable reefs, veins or lodes. Rhodes and his associates made diamond mining a science first—a correct principle in all mining—subordinating the speculative element. The yearly output of the DeBeers combination is worth more than Rhodes and others paid to acomplish that combination. The Premier Mine product is worth two and a half millions annually—or 40 times what Cullinan paid Prinsloo for the premises five years ago. A rich man's opportunity is thus presented for the control of diamond markets—until Canada or the States exploit their craters of which some have fallen into the precarious possession of the scrip peddler.

Later mail advices, under date September 19th, confirm the foregoing, although the statement appearing September 17th in the *London Times* that an arrangement between the DeBeers and Premier Diamond Companies for the sale of stones "had been concluded in outlines," is denier. The basis of the negotiations is, that "the output of the two companies will in future be pooled and sold in fixed proportions to the syndicate which at present deals with the DeBeers production only." All the parties concerned are hopeful of a "mutually satisfactory result," and it is believed that the Transvaal Government, which holds 60 per cent. interest in the Premier Mine, will not interpose since the maintenance of market prices for diamonds will favorably affect the profits derivable therefrom. Thus another trust approaches consummation.

A meeting of the Mining Society of McGill University was held at Montreal on Friday, November 8th in the Mining and Metallurgical Building of the University. An interesting paper was presented and read by Mr. Bell, followed by a discussion in which several present participated.

A METHOD OF MINE SURVEYING.

For my own use I have devised the following method of instrumental work and preserving of notes which I find answers the purpose exceedingly.

I think it is particularly free from many of the defects of those methods I have heretofore seen.

The only requirement to the ordinary mining transit is to have the horizontal limb graduated from 0°00′ to 360°00′ in either direction, but preferably to the right, i.e., a rotation to the right through north, neast, south and west increases the angle read by the vernier.

In ordinary work only one vernier is used, but in cases where extremely accurate results are required, as when placing sills on lower levels to catch those on the next higher as in square sets, both verniers are used and the angles doubled. This does not alter the method of entering notes in the record.

Sights wherever possible are taken horizontally, the elevations being run later by means of the telescope bubble and a short levelling rod.

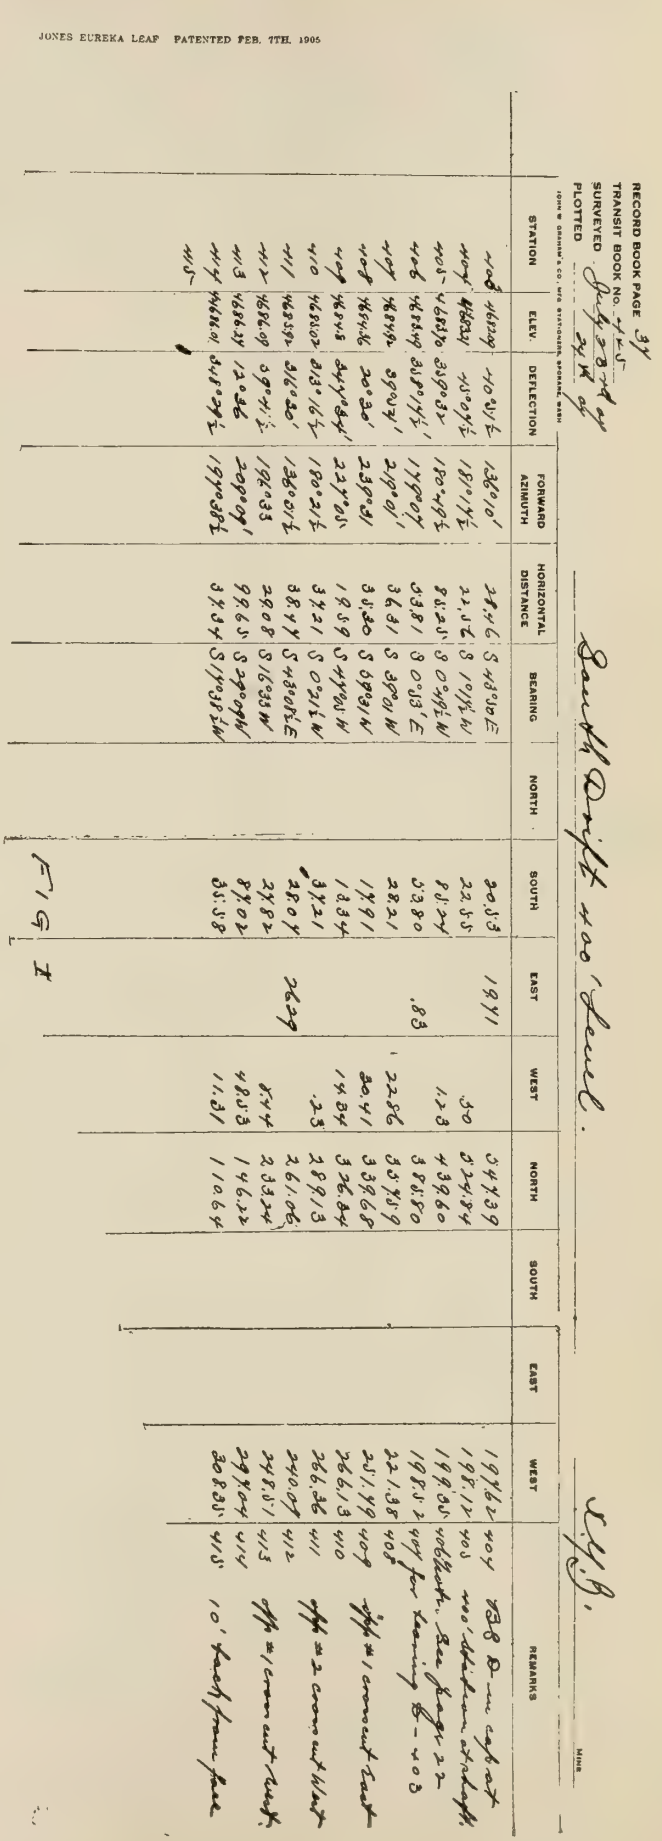
This, of course, applies to the main hubs rather than to the unimportant side points.

In steep sights, or where it is more convenient, the slope, distance and vertical angle are measured.

The field book has five columns. The first contains the numbers at beginning and end of course; column two the deflection angle, column three the distance, and column four the vertical angle if the course is measured along the slope. Finally the fifth column contains the number of the back sight.

To eliminate errors of collimation the telescope is not transited about its hor. axis, nevertheless, although the telescope is turned through the interior angle, it is the deflection angle which is read. This is done by merely setting the vernier at 180° instead of at zero for each reading. Suppose the vernier set at zero, telescope inverted and clamped along the back sight. Turning the telescope about its horizontal axis gives a F. S. exactly 180° from this. Any reading of the vernier will indicate the deflection angle.

If, however, the vernier be set at 180° and a B.S. taken, and the telescope be turned about its vertical axis through 180° it will read 0°00′ and its line of sight will coincide with the former, therefore whatever reading be indicated by the vernier will be the deflection angle.



This as stated before eliminates on one reading the collimation errors.

Fig. I. shows a sample page of notes. This page is 8 1-4 by 19 inches, and being of the loose leaf form is contained between solid covers and can be added to or altered without defacing the work.

The station numbers in the first column refer to the beginning of the course on that line, i.e., it is the hub where the instrument is set up. The number in the next column is the elevation of that hub. In the third column the deflection angle as read in the field is entered, directly from field book. The "forward azimuth" of any course is in the fourth column. It is the deflection of the course from a true north line, the quantities in this column being always "the azimuth of the preceeding course plus the deflection of the required course minus 360°, if their sum be greater than 360° thus, example:

Azi 403-404 + deflection 404-405 = Azi 404-405 or

136°10′ + 45°07½ = 181°07½ = Azi 404-405

Again

Azi 405-406 + deflection 406-407 = Azi 406-407 or $180°49\frac{1}{2} + 358°17\frac{1}{2} = 539°07$ = Azi 406-407 and $539°07 - 360° = 179°07$ = Azi 406-407.

Considering these examples, it will be noted at a glance that there is no possibility of error as to the deflection being right or left, an error being apt to occur in small deflections where the method of a ° "left" or "right" is used. Also all collimation error is eliminated.

The sixth column gives the course in terms of the compass, i.e., N, E, S or W, and is derived directly from the forward azimuth column, thus:

Forward Azimuth.	Bearing.
0°00′ to 90°00	N.E.
90°00′ to 180°00	S.E.
180°00 to 270°00	S.W.
270°00′ to 360°00′	N.W.

From this last column the latitude and departure co-ordinates are reduced, and these co-ordinates refer to the hub whose number is in column on "Remarks." (Through a typographical error the proper column for these foresight hubs was omitted.)

As a check, I close the survey on the starting point, using the same hubs but different angles. Only one series of set-ups, however, is required. Suppose the instrument set up on hub 410 B.S. on 409, F.S. on 411 and read deflection angle to 411. Now unclamp, reset at 180°, B.S. on 411 and F.S. to 409, noting deflection either an another page or underneath the previous deflection.

The second deflection should be equal to 360° minus the first. Any error is spotted at once, in the field, and the the method also eliminates the possibility of repeating an error and gives two readings, the mean of which can be accepted as correct.

In making simple connections, running raises, etc., the auxiliary telescope is used as a top scope, but for more accurate work as a side scope, to eliminate slight errors of adjustment of horizontal axis.

In steep sights where the auxiliary is used as a side scope the back sight is taken with the latter, then the foresight made from vernier. This, however, does not give the true azimuth and necessitates some corrections covered by formulae A.

Fig. II. represents instrument set up at D 111 at the collar of shaft, say with the side scope backsighted on D 110, the azimuth or bearing of 110-111 being known the azimuth of line of sight from D 110 through side scope is = azimuth of 110-111 $\mp$ tan an —1 d-D (the minus sign being used when side scope is to right of observer and vice versa) when d = perpendicular distance between telescopes and D the horizontal distance 110-111.

Now turn telescope around both axes; but do not transit; and foresight on 112 through side scope. This deflection added to the azimuth of backsight through side telescope gives the azimuth of foresight through the side scope thus Azi (D 110—D 111) $\mp$ tan d—D + deflection = azi of line of sight through side scope.

The slope distance from centre of telescope at D 111 to D 112 and vertical angle being measured, the horizontal distance D is calculated and the small angle d=d is tan —1 d—D, whence the azimuth D 111—D 112 becomes azi (D 110-111) $\mp$ tan —1—D + deflection $\mp$ tan —1 d—D, the upper or lower signs being used

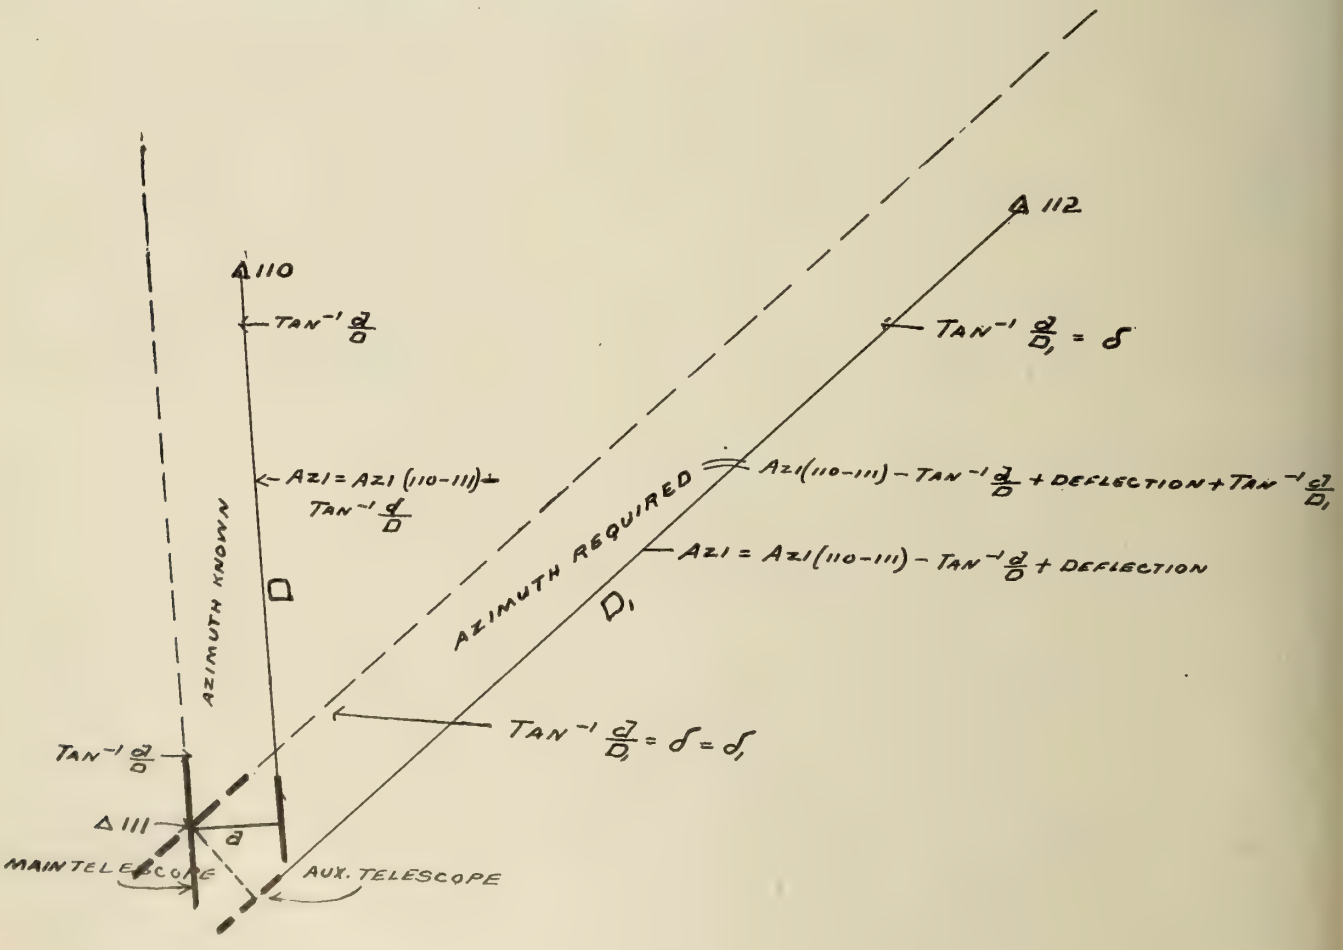


FIG 2.

when side scope is respectively to right or left of observer. This operation is repeated with the horizontal axis at 180° to its fist position.

Extremely accurate results can be had in this way even if the instrument be considerably out of adjustment.

If it is required to run a line from some known hub to some other known hub, the bearing of the line required is calculated from the latitudes and departures of the two hubs. This bearing is converted into azimuth and the deflection from the nearest known hub is the azimuth of the required course minus the azimuth of the preceeding, thus:

Deflection = azimuth course required—azi of course containing back sight.

This method I have no doubt will be familiar to many, though I have never seen it used or described. It is one I devised for my own use as being one less liable to error than any I know of. No doubt it can be expanded or altered to suit special conditions, but personally I find it all to be desired, as it is equally suitable for shaft work drifts, tunnels, stopes and open cuts.

A. B.

EXCHANGES.

The *Colliery Guardian*, October 25th, editorially discusses qualification for coal mine managers' certificates. Whilst certain objections are developed against the interchange of certificates as between the United Kingdom and the rest of the Empire, the *Guardian* does not condemn such reciprocity entirely. It traverses Mr. Stokes' suggestion that three years' service in a mine abroad be taken as equivalent to one year in the United Kingdom.

The *Mining and Scientific Press*, November 2nd, gives a good article on "Jigging by Hand" in Mexico. "Hand jigs can often be effectively and advantageously used in treating dumps of low grade material, without crushing, and with but a very small amount of water, when the material is too fine to be economically sorted by hand." The advantages are summed up thus: (1)Need of a very small amount of water (2) low cost of installation; (3) facility for moving from one place to another.

Writing on pumping machinery employed in mining, in the *Mining World*, November 2nd, Mr. Jos. H. Hart endorses the use of compressed air. "Given an air compressor, the operation of the pump itself is extremely simple. It consists merely in sinking a well to a slightly lower depth to obtain the pressure head with which to operate . . . In ordinary practice the height to which air can be elevated by this process seldom exceeds one and one-half times that to which the water faals in the well without reversal occurring. If the pipe which carries the air and water upward is tapped and more compressed air rejected, the process becomes continuous, and the water can be lifted to any height . . . The air lift process is much more efficient, however, than the ordinary surface pump. It possesses all the advantages of the ordinary single or multiple turbine pump."

Economic Geology, September-October number, presents a fine range of papers. One on the "Precipitation of Copper from Chloride Solutions by Means of Ferrous Chloride" is especially worthy of note. Gustave Fernekes is the writer. A series of analyses of mine waters was made upon samples from different mines at depths ranging from 800 to 5,000 feet. The waters proved to be more or less concentrated solutions of calcium chloride, sodium chloride and sodium bromide, with traces of sulphates. Concentration increased with depth. No copper was deposited by means of ferrous sulphate. The cause of the failure was the fact that metallic copper is soluble in hot dilute hydro-chloric acid. To make precipitation of copper possible the hydrochloric acid must be constantly neutralized. This neutralization can be brought about by the carbonates or silicates of calcium and sodium. Calcium hydroxide was first tried, then calcium carbonate and finally calcium silicate in the form of the mineral wollastonite. The experiments were successful, the copper being deposited in from ten to fifteen minutes' heating at 200 degrees C. Interesting, though tentative, conclusions are reached in the course of the paper.

PERSONAL AND GENERAL

Mr. H. J. Carnegie Williams, manager of the Bruce Mines, Ont., left recently for England.

Mr. T. J. Drummond, of Montreal, sailed for England on the Londonderry Iron Company's business on the 7th inst.

Mr. Jay P. Graves has returned to Spokane from attending the meeting of the Granby Company in New York.

Mr. R. D. Thompson has resigned as superintendent of construction at the Dominion Coal Company's collieries, Glace Bay, N.S.

Mr. W. S. Johnson, of Lachine, Que., is visiting the West on business in connection with his mining interests in the Slocan district.

An examination of the Laurentian gold mine in the Manito udistrict, Ontario, has recently been made by Mr. H. H. Newcomb of Boston.

Mr. William J. Penhallegon has resigned the superintendency of the Manitou Mining Company and the Frontenac Copper Company.

Mr. G. P. Player, late accountant for the Hall Mining & Smelting Company, Nelson, B.C., has opened offices on his own account in that town.

Mr. J. E. Hardman, of Montreal, has recently returned from an examination of an important new iron area in New Brunswick on behalf of clients.

Mr. S. Yamada, a Japanese mining engineer, in charge of an important copper mine in Japan, is visiting the smelters and mines of the Boundary district.

Mr. Anthony J. McMillan, managing director of the LeRoi Company has left Rossland enroute for England, where he will spend the next three months.

Mr. J. K. L. Ross, the new commercial manager of the Dominion Coal Company, graduated from McGill University in 1897 and is a son of Mr. James Ross, of Montreal.

Dr. John H. Banks, of Messrs. Ricketts & Banks, metallurgists, of New York, is preparing a special report on the extraction of metal values from the ores of the Cobalt district.

The report that Mr. Hays Hammond was about to sever his connection with the Messrs. Guggenheims, for whom he is acting in the capacity of advisory engineer is officially denied.

Mr. Alexander McLeod, consulting geologist, has recently returned to Sidney, C.B., from Newfoundland, where he was engaged in examining mineral properties for American clients.

Mr. Fred. Demuth, superintendent of the White Bear mine at Rossland, has denied the report that he is leaving the company's service or that the closing down of the mine is contemplated.

Mr. James S. Quigley, for the past five years underground manager at the Mabou mines, N.S., has accepted an appointment on the engineering staff of the Maritime Company's Joggins mines.

Mr. M. S. Irwin has resigned the secretaryship of the Hastings (B.C.) Exploration and other companies, leaving Nelson recently for California. He is succeeded by his brother, Mr. William Irwin.

Mr. Fred. G. White, until recently accountant at the Cariboo Consolidated, Bullion, B.C., has been appointed manager of a business department of the Yukon Gold Fields Consolidated, at Dawson.

Mr. W. Anderson, for many years superintendent of the Cascade Power & Light Company of Cascade, B.C., has been appointed hydraulic engineer to the West Kootenay Power & Light Company, with headquarters at Rossland.

Mr. Thos. Thompson has resigned as superintendent of the Dominion Iron & Steel Works' open hearth furnaces to accept an appointment in New York. He is succeeded by Mr. James K. Fraser, for some time past senior foreman.

Mr. C. H. Low, a director and secretary of the recently reorganized Payne Mines, Limited, of Sandon, B.C., accompanied by the company's engineer, has just completed an examination of the property, which is to be extensively developed.

Mr. H. Cecil, acting for a British Company proposing to erect a copper smelter on Uchuckleset harbor, near Alberni, B.C., is at present in the West securing estimates and other information to lay before the directors of the company in London.

Mr. T. R. Stockett, manager of the Western Coal Company's collieries at Nanaimo, B.C., in a recent interview stated that labor conditions there were now satisfactory and that the company was now able to maintain a daily output of about 2,400 tons.

Mr. W. J. Prisk, who retired recently from the management of the Dominion Antimony Company's mine at West Gore, N.S., was presented by the president, directors and employees of the company with a gold watch suitably inscribed, in appreciation of his services during his connection with the company.

Mr. A. G. Larsen, superintendent of the LeRoi mine at Rossland, reports that the property is looking exceedingly well, and that shipments are being maintained at the rate of 300 tons a day, which tonnage would not be exceeded until an improvement took place in the copper market conditions.

In a recent interview Mr. R. W. Coulthard, general sales agent of the Crow's Nest Coal Company, stated that two new seams of coal are being opened at the Morrisey, from which it was expected coal would be shipped early next year. The company has recently engaged a number of experienced miners from Wales and Staffordshire to work in the collieries.

Mr. Alexander Dick has resigned as general sales agent of the Dominion Coal Company. The resignation goes into effect on the 1st of May next. Mr. J. K. L. Ross, who has been with the company since 1900, has been appointed commercial manager, and will, it is understood, also have direction of the department at present under Mr. Dick's charge. Mr. Dick's resignation is much regretted.

CORRESPONDENCE.

Phoenix, B.C., Oct. 24th, 1907.

To the Editor,

Canadian Mining Journal, Toronto.

Dear Sir,—Allow me to congratulate you on the stand you have taken in exposing the methods of mining sharks in robbing (no other word fills the bill) the public by the sale of stock in companies owning a few acres of, in all likelihood, barren ground. This refers more particularly to operations on the reputation of Larder Lake.

The many glowing statements of this district, e.g., "Richest gold camp in the world," etc., are not only exaggerations but absolutely false. I spent a large part of last summer in the vicinity of Larder Lake, in fact, my camp was continually within a few yards of it, while working this district. The party consisted of five men, myself and partner (also an engineer), two guides and cook. We were prospecting for a syndicate, and it would be difficult to find a better outfitted party or one in which the work of prospecting was carried out with more method and study, the work of each day being gone over during the evening, all geological data, pro and con, being duly considered.

I can say that the country in which these big (?) finds are being made was pretty well covered either by myself or partner.

Now to the point. I am not at liberty (and even if I were it would not be advisable to make it public without certain qualifying statements) to state my views as to the richness of the district, but this much is a fact: the party disbanded in the fall without staking one single claim, and it was not deemed advisable to do any more work in that district. This conclusion was arrived at on the strength of my report.

I was fortunate enough in preventing many of my friends from losing money by investing in these wild cats, and though I was considered in the light of a pessimist at the time, my opinion has since been fully justified.

I should be much surprised to see anything but Dumpit (a name jocularly applied by miners to wash) come out of the district. Moreover, I am convinced that whatever ore, if any, does come to the mill will be in homeopathic quantities, statements to the contrary notwithstanding.

I remember some time ago reading an advertisement of a company which had a 5 stamp mill on the way to one of its claims. Remember it was "on the way," not on the ground. After several flamboyant and fiery statements, the advertisement stated the desirability of erecting a 200 stamp mill from the proceeds of sale of stock.

At the most there could not have been more than 100 feet of drifting or sinking, and this could not have blocked out much ore (in keeping with the statements of these men there was probably none at all).

Now Mr. Editor, can you conceive of the knavery of men who will deliberately put before the public such barefaced frauds to rob those who have in the course of years saved a few hundred dollars; for these are the ones who are caught. Men with capital who can afford to lose are not tempted by such bait. They know too well that good properties need no advertising to raise money for development. Only those to whom sums of a few hundred dollars appear fortunes are convinced by such, and they are not in a position to find out the actual facts.

Mining is a legitimate profession, and many honorable men are to be classed amongst its members, and if miners do not wish to have the name "Mining Engineer" synonomous with shark it is up to them to discount and expose the practices of these vicious pirates.

It has taken British Columbia many years of uphill work to regain her credit as a mining province, a credit which had been strongly jeopardized by these get-rich-quick leeches. The press of Ontario and Quebec has it within its power to eliminate the tremendous losses to the public and the discredit which must inevitably follow the indiscriminate advertising of fake mining companies.

Yours truly,

LEGITIMATE ENGINEER.

OBITUARY.

Mr. Harvey Graham, assistant general manager and a director of the Nova Scotia Steel & Coal Company, died at New Glasgow on October 31st after a somewhat tedious illness. Mr. Graham had been associated for many years past with industrial enterprises in Nova Scotia, having been manager of the Nova Scotia Glass Company, Black Diamond Coal Company, and New Glasgow Iron & Coal Company up to the time the latter was absorbed by the Nova Scotia Steel & Coal Company. Recently Mr. Graham undertook the task of perfecting arrangements for the development of large iron ore deposits in Brazil.

The death occured near Duncans, Vancouver Island, on the 28th ultimo, of Mr. Clermont Livingston, managing director of the Tyee Copper Company, and a gentleman very highly esteemed and respected throughout the Province of British Columbia, where he resided for fifteen years. Mr. Livingston after acquiring the Tyee mine some years ago first organized a small development company, which was finally merged in a bigger concern, and erected the smelter at Ladysmith, which has been very successfully operated. In the words of one of his contemporaries: "The death of Mr. Livingston is a distinct loss to the mining community. His properties have been the most straightforwardly managed and straightly conducted of any in the Province, and his name has been a synonym for honest dealing. Even when it was against his own interests and that of his company he has not checked the truth, and the result has been that capital at home and abroad has had the fullest measure of confidence in him and his judgment."

The Canadian Mining Institute and the mining industry generally has suffered a severe loss in the death of Mr. John Blue, which occurred on the 2nd inst. at Eustis as a result of an accident. At the time Mr. Blue, while overseeing certain work at the mine, was struck and run over by a water car, sustaining injuries from the effect of which he only lived a few hours. Mr. Blue was born in Scotland, but coming to America as a young man, engaged in engineering work and later was put in charge of important operations in connection with the building of the Hoosac tunnel.

For many years past he has occupied the position of superintendent of the Eustis Mining Company's works, at Eustis, Que., and was one of the charter members of the Institute, on whose Council he has served as a representative of Quebec mining interests and subsequently as a vice-president. At the funeral, which took place on Monday, November 4th, the Canadian Mining Institute was officially represented by Mr. John Penhale. The Institute also sent a wreath of flowers and a telegram of condolence as follows, which was despatched to the widow of the deceased:

Mrs. John Blue, Eustis:—Officers and members of the Canadian Mining Institute desire to express deepest sympathy in your sad bereavement and to record their great regret at the untimely loss of one of their oldest and most respected members.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.—It has often been said that one must leave home to learn the news, and we have learnt some most peculiar news from an article that was recently dished up for the delectation of the innocent readers of the "New York Times." This precious screed is a fair sample of the "guff" with which some papers feed their readers, and it is perhaps hardly worth while quoting except that its very ridiculousness may amuse some of our Glace Bay readers. The effusion in question ran as follows:—

TOPICS OF THE TIMES.

FAME CAME BY MERE LUCK.

"Glace Bay, the name of which—though not its pronunciation has suddenly became known all over such parts of the world as counts, was about the last place that even a long-distance prophet would have picked out for a glorious destiny. All there was to Glace Bay before Mr. Marconi, driven from Newfoundland by the futile jealousy of the cable company, went there was the bay, and the bay itself is a poor thing, as bays go, a mere shallow inward sweep of the Nova Scotia coast, with no protection for ships and therefore no town. Indeed, there is hardly a hamlet—just a thin scattering of mean houses over sterile, rocky hills.

"There is, to be sure, a little station on the disconsolate little branch railway that wanders down from Sidney to Louisburg and serves a few coal mines and sawmills, but one could hardly imagine anybody's stopping there except from stern necessity or staying any longer than the stern necessity compelled. Most parts of Nova Scotia have a rugged beauty, but the region around Glace Bay is only dull—so dull that even the second growth birches and spruces that cover most of it have given up in despair and died before they were worth cutting.

"Had it not been for the fact that Louisburg is just beyond, nobody would ever have even passed through Glace Bay or known of its existence, but as it is, a good many people have given the place a glance, for Louisburg, even though it hasn't much to show the visitor, does remind him of great events and make him wonder why a fortress that cost the King of France unnumbered millions to render impregnable should have fallen as soon as a few companies of New England militiamen made an attack on it. But nothing ever happened at Glace Bay, and, as it dosn't seem any better fitted for a wireless telegraph station than any other spot along that coast, its selection for its high destiny and sure immortality is at least as mysterious as anything connected with the new method of communication.

"As for the pronunciation of the name, it is as simple as possible, with the "a" like that in "race" and no Frenchified toyings with the final "e." At least that's the way the folks living thereabout speak it, and if they do not care to remember its origin there is no reason why anybody else should do so. The name was chosen, doubtless, because any ice that wanted to drift in and accumulate there was free to do it to its heart's contend. The word is English and meaningless now, however, and its fate is only another illustration of the failure of the French to make any lasting mark on the province that cost them so much and was relinquished so reluctantly."

We may give the genius who penned the above some little information that he badly needs. Although according to him "nothing ever happened at Glace Bay," it is a little more than "a little station on a disconsolate little branch railway." That "little branch," which by the way is some 40 miles long, handled last year over 4,000,000 tons of coal; the little hamlet he speaks of is an incorporated town with a population of about 15,000, and the "few mines and sawmills," furnish almost the entire provincial revenue of the Province of Nova Scotia. There is another "little" industry at Sydney, which is altogether indebted to these mines for its existence and profits, we mean the works of the Dominion Iron & Steel Company. The shipping port of the mines is Sydney, and at Sydney, we may say they have the largest colliers afloat, and the most efficient coal piers on this continent.

We have an idea that the gentleman who wrote the article in question, gives the show away, when he comments on the local custom of pronouncing Glace Bay as "Glays Bay." He knows too much not to know more, and perhaps the whole thing is a labored joke. Maybe the scribe was one of those whom Signor Marconi, caused to sit out in a field, where they had a lovely view of the October woods, and a very distant view of the Marconi Towers. Some of these same gentlemen were very sore and passed backhanded compliments to the great Italian in their various sheets. It is possible that one of them hailed from Ney York. There is one germ of truth in the whole article. The writer states that the region around Glace Bay is "dull." We admit it, but has the writer ever heard an old Yorkshire proverb which says: "Where theres muck theres money"? Glace Bay has the full sweep of the Atlantic gales to purify its atmosphere, and while no one ever accused it of being a beautiful place, it has all the scenic distinction of a rugged coast line and a boundless sea front.

Newspaper reporters do offer some remarkable information every now and then, particularly when they venture on technical matters. There is a tradition around Glace Bay, that on the occassion of the Caledonia explosion many years ago, one local paper informed its readers that "the bottom of Caledonia Mine had fallen out." We noticed recently in a newspaper paragraph describing the progress in pumping at the Hub Mine, that "but a comparatively small quantity of water remains in the pit bottom." At this rate there must be quite a lot of water in the deeps yet! At various times these same reporters assure the country that such and such mine is either nearing its finish, or that it has still many years to run. These estimates it is strange to contemplate vary with the politics of the newspaper, and they are given quite gratuitously and free of charge. However, they are not worth anything. Everybody must have noticed that whenever a news paper reports an occurrence with which they are quite familiar, the report is incorrect in some particular or other. Yet every other occurrence reported in that paper, we accept as gospel, so great is the respect born in us for the printed word. The probabilities are that they are no more correctly reported, than the occurrences we happen to know about.

As was anticipated the output of the Dominion Coal Company's mines for October, was the largest of the year, being a little over 342,000 tons. The output for October last year was 350,000 tons, notwithstanding the fact that on the 21st the reserve bankhead was burnt down. Had the Hub Mine been working this October, the output would easily have been the largest on record for the Coal Company's mines. The labor situation is easier owing to the fact that the picnic season is over, and that men are returning to the mines from their farms, and from Newfoundland. There will be no slacking in outputs till the end of November, and coal is being shipped up the St. Lawrence at a great rate. Shipments will be continued as late as possible.

Following on the appointment of District Superintendents, by the Coal Company, is the appointment of Mr. James D. Maxwell to the position of manager of Nos. 2 and 9 Collieries. Mr. Maxwell was formerly assistant manager of No. 2 Colliery, and has for some little time back been the manager of International Colliery. His place at International will be taken by Mr. Bart. Connors, late assistant manager of Reserve. Mr. William Wilson, has been appointed to the management of the Hub Mine—No. 7—in place of Mr. Robt. Robertson, resigned. Mr. Wilson was for some time underground manager of No. 7, and has lately been engaged as coal inspector for the whole of the Coal Company's mines.

Mr J. K. L. Ross, the son of President James Ross, has been appointed commercial manager of the Dominion Coal Company, at Glace Bay, with charge of the commercial operations of the company, including the shipping, sales, railway and stores departments.

The contract for the grading of the Victoria Branch of the Sydney & Louisburg Railway has been given to the Lindsay Construction Company, who recently completed a contract on the Halifax & South Western Railway. They have leased the Grand Lake Hotel, and are already vigorously pushing the work. Up to date about two miles of right of way has been cleared, and grading has been commenced at three points on the line of route.

The vagaries of the Stock Market are beyond the understanding of the average man. Why should Dominion Coal drop to 37 and Dominion Steel to 13, when both concerns are getting bigger outputs, and if payrolls and shipments are any indication, are in better condition than ever before? Stock market quotations do not seem to be much of an index to the actual health of industrial concerns.

The Dominion Coal Company have let contracts for 100 miners houses in the No. 2 district. These houses will all be completed in time for occupation next spring, when No. 2, 9 and 7 mines will be putting out about 120,000 tons a month. In October No. 2 bankhead dealt with over 100,00 tons of coal, quite a respectable performance. The erection of four new Babcock & Wilcox boilers has been commenced at this colliery to meet the increased demands for power neccesitated by the recent additions of electrical generating plant.

The North Atlantic Collieries Company are making steady progress at Port Morien. General repairs have been made of the houses and plant. About fifty men are at present engaged at the patchedmine and the daily output is about 150 tons. New boilers, and a new smoke-stack have been installed, and a new haulage rope put on. The first shipments made by the new company were dispatched in October, some 100 tons being sent to Newfoundland and 600 tons to Quebec.

The Dominion Iron & Steel Company, according to a report that appeared in the "Sydney Record" of 19th Oct., have leased the areas of the New Brunswick Iron Company, at point Lepreaux, N.B. The lease is for eighty years, on a royalty masis of 25 cents per ton. The directors of the New Brunswick Iron Company, are as follows: C. V. Wetmore, John S. McLennan, F. P. Jones and F. A. Crowell, of Sydney and Jas F. Robertson, of St. John. The Steel Company will develop the property, and ship ore to Sydney for use in their works.

ONTARIO.

COBALT.—There has been another rich strike of silver on the Silver Leaf, causing renewed interest in this property, which has improved rapidly the last few months.

The McKinley-Darragh are shipping some very rich ore; returns from a 25 ton car produced pure silver, 61,200 oz. Smelter charges were $400.00 per ton, freight charges $25.00 per ton, mining expenses averaging $60.00 per ton, total $485.00 per ton. This makes a net profit of $49,075.00.

The Temiskaming & Hudson Bay Mining Company are building extensively on their property adjoining Trethewey. A large sleeping camp is nearly completed.

The men at the Badger Mine went out on strike the other day, the management having returned to the 10 hour a day. New men were at once employed. There are too many idle men in the camp at present for a strike to have any effect.

Cross cutting at the 85 foot level, the Cobalt Lake Mining Company struck their "Niccolite" vein. Here it averages over 28 inches in width, and carries much higher cobalt values than at the surface. This is in all probability the most wonderful vein of its kind known. On vein No. 4 of this property, they have again found rich Argentite and Native Silver values.

SILVER BIRD.—About one mile and a quarter to the northeast of Cobalt town and adjoining Bucke Township, is the Silver Bird property. On a visit to this prospect, we found that operations had been suspended.

The property consists mostly of swamp land, the geology of the rock formation is difficult to determine, as there are few, if any, rock exposures being covered by heavy "drift." Doubtless during their operations they discovered rock, as a rock heap of some dimensions was found at the shaft-house, which was built on a slightly elevated piece of ground overlooking a small creek.

The buildings consists of shaft-house, boiler-house, small though comfortable sleeping camp, besides one or two other small buildings.

It is evident that the management had great faith in the camp, having to sink through such a depth of drift. Prospecting for veins had to be done by cross-cutting, undeniably a very expensive operation. Evidently, as the work has ceased, no "pay vein" was encoountered.

This property at one time in its history was famous on account of the extent and character of the advertising given to the stock, which was placed on the market seemingly at a very low figure; much energy being displayed by the brokers who handled it in the construction of the advertisements.

"See Silver Bird Fly." Has it flown?

ALBERTA.

Mr. Sherman interviewed gave out the following statement: "The final sitting of the board has resulted in a disagreement, as, on behalf of the men I represent I could not possably agree to the report, which will be forwarded to the Government, as adopted by Mr. Fisher and Mr. Macdonald. They will draw up their own report and send it in, and I will send a very different conclusion. The Government will consider the evidence taken on the case and thresh the matter out. Regarding the mines at Hillcrest, it is now up to them. They can strike if they want to or they can continue work, but I will certainly refuse to recommend the report to them, as made by Messrs. Fisher and Macdonald, I cannot give at present any details of the disagreement, as both reports will have to be sent to the Minister of Labor first. Afterwards they will be given out."

HILLCREST.—The conciliation board under the Lemieux Act, appointed to investigate and report on the labor trouble at the Hillcrest Mine near Frank, has held its final session. The board which consists of Hon. C. W. Fisher, the chairman and J. R. MacDonald representing the operators, and F. H. Sherman representing the United Mine Workers of America, could not arrive at an unanimous verdict. Messrs. Fisher and Macdonald made the report, which will be presented to the Minister of Lobar, without Mr. Sherman's signature. The board had a long conference disucssing the evidence taken at the previous sessions, but after many hours of work they found they could not agree, and the meeting adjourned. Mr. Sherman immediately left for Calgary, while Mr. Macdonald remained to draw up the report to be presented to the Government, as drafted by Mr. Fisher and himself.

The Hillcrest Coal & Coke Company were fined $200.00 and costs, at Frank, for locking out about a hundred of their miners, while the Arbitration Board was sitting for the purpose of trying to bring about a settlement of the dispute between the company and the men.

The company closed down their mines and posted a notice requesting their employees to accept the company's terms or remain idle. This the miners claimed was a breach of the Lemieux Act. The men instituted proceedings against the company and obtained a conviction. This is the first conviction under the Lemieux Act obtained in the West, if not, in the whole of Canada.

Hillcrest is a mining camp lying about 3 miles, in a easterly direction from the town of Frank. The camp is tapped by a spur line from the Crow's Nest branch of the C.P.R. The principal seam of coal at present being mined, is about 15 feet in thickness, and is a high grade steam coal. The C.P.R. has contracted for a large quantity of the output from the Hillcrest mines.

Labor troubles have been going on at the mines more or less for the past 8 months, and have been brought to a head by the present disagreement.

The Hillcrest Coal & Coke Company is one of the few companies, which has not joined the Western Coal Operators Association.

HOSMER, B.C.—The Board of Investigation appointed under the Lemieux Act, to report on the labor troubles at Hosmer have concluded their investigation, and have forwarded a unanimous report to the Minister of Labor. A few minor points were conceded on both sides, and representatives of the company and of the workmen came together and amicably threshed out several points with the result that a satisfactory basis for agreement was reached. The board consisted of Judge Wilson, chairman; F. B. Smith the company's representative and F. H. Sherman the representative of the workmen.

BRITISH COLUMBIA.

THE KOOTENAYS.—The recent fluctuations in the price of copper and silver have affected this district in a more or less degree during the past fortnight. At the present writing copper is slowly climbing back up the hill of higher prices and with it the spirit of the district is taking on a more elevated feeling. A few days ago when copper made the lowest point it has seen in a long time, things looked really seriuos for the copper mines of this country, but with the price of the red metal ascending, affairs look brighter just now. Copper need not sell at an abnormal figure to enable the mines of this section to work at a fair profit. While most of the ore is low grade, mining on a large scale, as we are doing at the present time, will place the mines in a position where they can realize a good profit and continue successful operation, if copper sells at anywhere near a general market price, say, sixteen to eighteen cents per pound.

It is obvious even to the cursory observer that monetary conditions will have to be much more serious than they are at the present time, to precipitate anything in the nature of a panic here in the West. In this district the business men are meeting their obligations promptly, and are enjoying a good steady trade.

Taking everything into consideration, the mines and smelters operating at a fair profit, the merchants doing a steady business and the general population with plenty of money on hand, it looks as though the affairs of this district would show up well on the balance sheet at the end of the year.

The big mines are working steadily at Rossland, but there is a small surplus of labor. This is principally caused by many of the old timers and quite a few new miners coming here from the Butte and other districts, where the copper mines have temporarily ceased to operate. Upon the renewal of activities at some of the Butte mines recently, many of the miners who were in a position to do so returned to that point to get back their old positions.

The White Bear Mine has closed down, temporarily it is stated, and it is not known when they may resume work. The pumps have been taken from the mine and it will be allowed to fill with water. It is a much more economical operation to allow the mine to fill with water, provided they may be idle two months or more, than to pump steadily, as the mine when full of water can be pumped dry for the same sum that it would take to keep the water out for a month.

The Consolidated Mines are shipping approximately 4,000 tons of ore per week and Le Roi about 2,000 tons. These are good average shipments and may be materially increased in the future, on the part of Le Roi Company, anyway. Development work on the Consolidated property is being earnestly pursued and the showing on the Idaho claim continues to improve as depth is gained. The workings on this claim, from the surface, are now down over 200 feet in depth. The new motor and rope driven compressor, which was recently started up, is running smoothly now and doing good work. This type of a drive is a great improvement, both from an efficient and economical point of view, over the old steam driven compressor, electrical motor power costing here approximately $34.00 per annum.

Mr. Thos. Kiddie, well known throughout this country, has been appointed manager of the Northport smelter, vice Albert J. Goodell, who recently resigned. Mr. Kiddie will relieve Mr. Goodell on December first, when the latter will leave for Marysville, B. C. to take charge of the smelter of the Sullivan Group Mining Company, at that point.

Mr. Kiddie is known as a capable man and has done much good work in the Province. He designed and erected the smelter of the Tyee Copper Company, at Ladysmith, and operated it until he assumed charge of the Britannia Smelting Company's works at Crofton. He leaves the service of the Alaska Smelting & Refining Company, of Hadley, Alaska, to come here. The successful smelting of Rossland ores is a task that requires earnest application and Mr. Kiddie will find plenty of that work here, which delights the heart of the specialist. There has been much discussion indulged in as to whether Le Roi ores can be smelted cheaper at the plant of the Consolidated people at Trail, B. C., than they can be treated at Northport. The late management at Northport claim that they beat the Trail figures. Contrariwise, the advocates of Trail smelting have things to say in a different light. So Mr. Kiddie will have an excellent opportunity to do some good work at Northport for Le Roi Company.

The Japanese have been quick enough to recognize to true worth of the copper deposits of British Columbia, and have acquired large interests on the Coast, at Ikeda Bay, Moresby Island, where they have a large force at work. It is humorously stated that there is only one white man on the job, and he drives a horse. Mr. S. Yamada, consulting engineer for these people, passed through this district a few days ago. One could not help but note the assiduity of this Japanese engineer, when inspecting the mines. He did not see much of any of the properties outside of the Consolidated, and he only investigated certain work at that property. He delved deep on special features, such as drifting, sinking, etc.

Owing to the reaction in the price of copper, wages may be placed back on the old scale, in the Boundary District, in the next few days. If so, it is very likely that Rossland will fall in line.

In the Boundary District the Dominion Copper Company's plant still remains idle, awaiting word from the officials of the company. Sufficient steam is being made to keep the pumps going, but that is all. The general feeling in the Boundary, is that the Dominion Copper shut-down will be of, but short duration.

There are rumors of an amalgamation of the Dominion Copper and British Columbia Copper interests. A consolidation of these two concerns would be a money making venture, from more than one point of view.

The big mines in the Boundary are not doing as much development work just at present, as they were a few weeks ago, hence they are not employing as many men in their mines. However, the ore shipments are being maintained at a steady output, and outside of the Dominion Copper Company, the district is busy and working along as usual.

The Granby Mines are shipping about 3,000 tons per day to its Grand Forks smelter; the Mother Lode Mine (B. C. Copper Company), is shipping from 500 to 600 tons per day to their own smelter at Greenwood; and the Snowshoe Mine, Phœnix (Consolidated Company), is shipping a large output to both the B. C. Copper Company and Trail smelters. The total shipments from the Boundary for the week ended Nov. 2nd, were 30,739 tons; total for the year to date 1,087,587 tons.

Comparing these figures with the Rossland output, one recognizes the importance of the Boundary District: Shipped from from Rossland during the same week 6,465 tons, and for the year 229,284 tons. But this output will be materially increased in the future.

The Providence Mining Company, operating the high grade Providence Mine, at Greenwood, held their annual meeting in Greenwood about ten days ago. The old officers were re-elected, and an issue of bonds to the extent of $50,000.00 was authorized. These bonds will bear 6 percent. interest and the proceeds will be used to sink the workings to the 1,000 foot level.

The Maple Leaf Mine, at Franklin, up the Kettle River from Grand Forks, has closed down for the season. This will leave the camp practically deserted for the winter. There are some excellent showings at Franklin camp, and Mr. F. Aug. Heinze had a bond on some properties there. The people of Grand Forks are wondering if Mr. Heinze will now have time and money enough to take up his bond.

The Princeton Liberal Association has been making overtures to the Government with a view to having the platinum fields of the Tulameen district examined by one of the geologists of the Dominion Geological Department. They have been given to understand that an effort will be made to meet their wishes in the premises. Platinum has been known to exist in this district for a long time, and an official report on the deposits would be of great value to the many who are at present interested.

In the Slocan a good strike of ore has been made on the Highland Light claim at Eight Mile, and it is also reported that the Ottawa Company has made a strike of importance in the long tunnel that they are driving on their property.

Things are going along in the Ymir District. The Queen Mine is showing up some good ore and work is being done along the usual lines. A rich strike of free milling gold ore, has just been made on the Devlin group, which is close to the Queen. There are some who predict that the Ymir District has not seen its best days yet. There are many properties with excellent showings in that district, and it certainly looks as though there should be some good mines, where the indications are so good.

The Hewitt Company is putting in a new electro-cyanide process, devised by a Spokane man. It is claimed that this process will make a saving of approximately 90 per cent. in the tailings,

the usual saving being about 70 per cent. If Professor Parks' process will save 90 per cent. he will have placed a device in the hands of the milling people that will be worth millions of dollars to them, and he will incidently reap a golden harvest himself, for there is hardly a milling plant in the country, but is sustaining a heavy loss in this direction at the present time.

Three additional furnaces are to be installed at the Sullivan Group Mining Company's smelter, at Marysville, B. C. The present plant has a capacity of about 120 tons per day. The mine is shipping about all the ore the smelter can handle. A new strike has been made on the 100 foot level of the mine, assaying from 60 to 70 per cent. lead, silver 1-2 ounce to one per cent. lead. Between 50 and 60 men are employed at the mine and considerable development work has been laid out for the near future.

It is rumored that A. I. Goodell, recently resigned from the Northport Smelter, will assume charge of the Marysville Smelter. Mr. Goodell is a man who has had a life long experience with the treatment of lead-silver ores and would be an invaluable man to the Sullivan people.

The board that is arbitrating the differences between the employers and employees of the St. Eugene Mine, Moyie (Consolidated Company), will meet at Nelson, B. C. on Nov. 6th, and go into the matter at further length. In view of the decline in the prices of silver and lead it is hardly expected that the demands of the employees can be acceded to—but we will know more about this anon.

The Hillcrest Coal & Coke Company, Hillcrest, Alberta, have recently been fined $200.00 under the Lemieux Act, for locking out a hundred or so of their miners, while the dispute between the company and the men was being arbitrated. The Hillcrest Company, has had a lot of trouble with its men, and it would seem that it was about time they got together and settled theid differences quickly and got down to hard work.

Mr. D. Davies, Comptroller for the Crows Nest Pass Coal Company, Fernie, for some time past, has resigned and will be succeeded by A. Klauer, erstwhile chief clerk in the Fernie office.

Mr. R. G. Drinnan, general superintendent of the Crows Nest Pass Company's mines, has also resigned and will go to Hosmer, there to succeed Mr. John Brown. Mr. Drinnan is a man who has spent the greater part of his life at coal mining and knows every round of the ladder. Mr. Drinnan will be an important factor in the opening up of 4,000 acres of coal land at Hosmer by the C. P. R. Company. The machinery is being installed at the present time to begin the work with. It is stated that the C.P.R. will produce coal in a year, on such a scale as will augment the production of the Northwestern Canadian coal fields to 1,000,000 tons per year. This with the many other properties that will be producing in the next year or two will place the country for hundreds of miles around, far beyond the pale of such a thing as a coal famine.

The C. P. R. has had an agreement with the Crows Nest Pass Coal Company, not to compete in coal production for 10 years from 1899, but the latter company will be only to glad to have them start in now, two years ahead of the agreed time, to help relieve the situation.

Nov. 5th, 1907.

GENERAL MINING NEWS

NOVA SCOTIA.

ANTIGONISH.—Under the supervision of Mr. George Corbett, a two mile road is being built to the Arisag iron mines. Tunnelling will be started as soon as the road is completed. Mr. Corbett intends spending a considerable amount of money on the property.

SYDNEY MINES.—In a short time coal will be conveyed from the new colliery of the Nova Scotia Steel & Coal Company, known as No. 4. Already the two and a quarter-mile branch railway, which will connect the new mine with the rest of the company's works, is about finished, so far as ballasting is concerned, and the moment the connection is completed, much is expected of No. 4. Next week work will be commenced for the erection of a new bank-head. At present there is at least two thousand tons of coal on the bank, which will be quickly used up once the line is connected by railway.

The month of October will go down in history as a record one, so far as the Nova Scotia Steel and Coal Company is concerned, in the output of its collieries and blast furnaces. Although men employed on the big works lost considerable time at the beginning of the month, latterly a decided change has taken place in the number of men showing up to wark after pay days. As a result of this steadiness on the part of the men, last month's output of the different collieries, not including No. 4, exceeded the month of September by nearly nine thousand tons. Following are the figures for October:

No. 1	24,256 tons
No. 3	26,256 tons
No. 5	6,599 tons

This gives a total of 57,071 tons against 48,656 for September, an increase of 8,415 tons.

In the steel department the same degree of activity prevailed, there being an increase over the previous month in every department. The output of pig iron was 5,755 tons, increase of 300 tons over month of September; steal output reached 6,986, being no less than 1,476 tons more than in September; while 8,772 tons of coke was produced, being 1,100 tons more than in the previous thirty days.

SYDNEY.—The survey of the shore line from Sydney Mines to Point Aconi, has been begun. The Steel Company claim a right of way through the Coal Company's areas via the Burchell property, to reach their submarine areas. This the Coal Company dispute.

GLACE BAY.—Mr. J. K. L. Ross has been appointed commercial manager for the Dominion Coal Company.

Mr. Alexander Dick, has resigned his position as sales agent. His resignation will take effect nevt April.

HALIFAX.—The formal order for judgment in the Steel-Coal case was taken out by the Steel Company's solicitors, on Saturday, before Judge Longley. The defendant Coal Company has ten days within which to give notice of appeal.

In the decree the Judge declined to formulate his findings of fact, or to state the basis on which he required the contract to be specificially performed.

The defendants asked that the specific findings of fact be put on the face of the judgment, and if the contract was to be specificially performed that the judgment should state what the Judge holds, the contract required as to quality.

The plaintiffs opposed having any findings of fact formulated or the Judge's interpretation of the contract stated.

Further directions are rescinded, and it is not known at present whether the Coal Company will be required during the 95 years to get out of the seam the Steel Company names, suitable coal, whether it is there or not, paying damages if it is not there, or what effort the Coal Company will be required to make to find

out if it is there in order to purge the attempt involved in not obeying the order.

Neither is any limit on sulphur contents yet stated. The per centage of sulphur in the coal, which renders it unfit for metallurgical purposes depends upon the percentage of sulphur in the iron ore and the limestone used by the Steel Company, and if the sulphur contents in the supply of these ingredients increase, the decree may involve a command to the Coal Company to mine from the seam named by the Steel Company, coal very much less in sulphur than any coal heretofore mined.

NEW BRUNSWICK.

FREDERICTON.—The Londonderry Iron & Mining Company have secured a lease of iron mining areas, eleven miles from Bathurst, ner the Nepisiquit River. A branch railway is to be built to Bathurst. The local Government is to receive a royalty of 5 cents per ton on all ore mined. The iron ore deposits are in the county of Gloucester, and will probably be known by that name.

ONTARIO.

COBALT.—At the annual meeting of the shareholders of the Foster Cobalt Mining Company, Mr. Frank Loring, their consulting mining engineer presented the following report of progress:—

On vein No. 1 shaft 45 feet was sunk, showing two to five inches of Cobalt ore for the entire depth. At vein No. 5 considerable high grade ore was extracted from the surface, as well as between it and the 75-foot level. The stope, which is 125 feet long above this level, and extends to an extreme height of 40 feet, has been mined, and the top of it has been connected with the surface by a shaft.

The stope on vein No. 6 has been continued towards the surface and southwesterly for a distance of 15 feet.

On vein No. 7 a drift 15 feet long has been driven from the 70-foot level of No. 5 vein. The face shows three inches of smaltite, and a well defined fissure. A drift has been constructed to the northeastward from the 70-foot level of shaft No. 5 on vein No. 8, exposing as much as 12 inches of Cobalt ore high in silver. This is now the best showing on the property, being indeed one of the most excellent ever developed on the mine, and it should be a large producer. Veins Nos. 7 and 8 will probably come together.

On vein No. 11 a drift 40 feet long has been made to the northeastward, from the 70-foot level of vein No. 5. Three streaks of Cobalt ore, aggregating four inches in width, have been exposed.

No. 5 shaft has been sunk 85 feet below the 70-foot level, and at 65 feet a new level has been started. The prospect is promising that extensive bodies of high grade ore will be encountered.

A rumour is going around that Silver Leaf, Nova Scotia and Keer Lake properties are to be amalgamated. The last named mine was bought from the Ontario Government originally, for $312,000. Whether there is truth in the report or not, it is easy to say. But no doubt an amalgamation would be most advantageous.

The new strike in the Cobalt Lake property, is more than two feet in width. It was made in a cross-cut, north from No. 4 shaft. The vein is largely smaltite and niccolite.

An electric railway is projected between Haileybury and Cobalt.

The Rothschild's mine at Cobalt has been turned over to the owners of the Kerr Lake mine, on a lease and bond similar to the system of many deals in the western camps. It is reported the sale price is to be $150.000, the option to run six months, and the operators agree to spend $30,000 indevelopment work in the meantime. A large force has been employed doing surface prospecting. This will be continued during the open weather, and during the winter extensive work will be done on the property with diamond drills.

The annual meeting of the shareholders of the Trethewey Silver Cobalt Company was held on the afternoon of Nov. 5th, and though a large number were present, the session lasted but a short time. No changes were made in the officers or in the Board of Directors. Some questions were asked about the dividend, but the answers were indefinite, no promises being made, though it was admitted that prospects looked quite bright. It was explained that ore shipments were being kept back because of unsatisfactory arrangements with United States smelters. It was stated that one smelting company actually desired $300 a ton to smelt ore, which was much higher than previously. It was intimated at the meeting that the company was holding back until the completion of the Deloro smelter in Hastings County, when shipments would be made there. The question of a concentrator is still under consideration on the part of the Trethewey management.

Cobalt's output for October, 1,124 tons sets a monthly record. Ten mines shipped during the month. La Rose and McKinley are the leaders. The camp's output for this year is estimated at over $7,000,000.

The annual statement of the Foster Mining Company, presented at the general meeting of shareholders held in Toronto on November 6th, shows a cash reserve of $63,00. The present board took charge in May. Of the 100,000 shares of treasury stock authorized to be sold last June, 15,585 shares have been sold, at 75 cents per share. Expenses have been curtailed and the company is reported to be sound and strong financially. Shaft No. 5 is down 140 feet. On the 140-foot level veins No. 1 and No. 2 have been drifted on. From No. 8 vein, composed of smaltite and native silver, a car load of high grade ore has been shipped recently.

SAULT STE. MARIE.—The ercetion of a large smelter at or near Sault Ste. Marie, is projected by the Canadian Smelting & Refining Company. The proposed capacity of the smelter is 150 tons. It will treat cobalt, nickle and copper ores. We notice the name of A. G. Penman, the promoter of the Cobalt Silver Mountain Mining Company, among those interested in the scheme. It would be well for Mr. Penman to devote his energies to pulling his Cobalt scheme out of the bog, before indulging in any more appeals to the public.

PORT ARTHUR.—Colonel Shaw, who holds 20 claims in the Silver Mountain District, has put in some development work on his claims. He reports a 6-foot vein on R. 65.

A large pump has been installed at the Beaver Mine. The mine in now unwatered. There are 40,000 pounds of ore ready for shipment.

ALBERTA.

LETHBRIDGE.—The Hillcrest Coal & Coke Company was fined $200. and costs for locking out miners while an arbitration board was sitting, thus violating the Lemieux Act.

BRITISH COLUMBIA.

FERNIE.—A landslide occurred over No. 9 mine at Coal Creek, in the last week of October. The slide was very light. There is no danger of a serious accident.

With the $700,000 received from the Granby Consolidated Company for stock, the Crow's Nest Pass Company will increase its output from 2,500 to 7,000 tons per day. The Granby Coompany is prepared greatly to increase its smelter capacity as soon as it is assured of a supply of 1,200 tons of coke per day from the Crow's Nest Pass Company, equivalent to 2,000 tons of coal per day.

VANCOUVER.—Mr. Thomas Kiddie, who designed and erected the Tyee Copper Company's smelter at Landysmith, and who has

been successively manager of the Britannia Smelting Company's works, at Crofton, and of the Alaska Smelting & Refining Company's smelter, at Hadley, Alaska, has been appointed to the management of the smelting works of the Northport Smelting & Refining Company at Northport, Washington. The Northport smelter consists of six furnaces. It is situated 10 miles from the international boundary and 18 miles from Rossland. The plant is actually owned and operated by the Le Roi Mining Company.

BOUNDARY.—Although the force at the Mother Lode Mine has been reduced by about 50 men, the output of ore has not fallen off.

A new crusher is to be installed at the B. C. Copper Company's smelter in Greenwood. It will be like the crusher now in use at the Granby mines and will be operated by an electric motor of 100 h.p.

ATLIN.—The Ottter Hydraulic Gold Mines Company suspended work for the season on October 12th. During the season 2,000 feet of flume and ditching has been made, giving a head of 150 feet. The ditch has a carrying capacity of over 2,500 inches. The dam, six miles from Surprise Lake, is 75 feet long and 12 feet high.

YUKON.

DAWSON.—The individual claimowners in the Dawson district have asked Commissioner Henderson to make representations to the Minister of the Interior, with a view to securing relief in the matter of water supply. It is stated that the Guggenheims hold possession of all water rights. This acts very detrimentally to private operators of placer ground.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

The text of a Royal warrant, by which the King institutes a new medal to be awarded in recognition of heroic acts performed by miners and others who endanger their own lives in saving or endeavoring to save life from peril in mines or quarries within the Empire, is published in a recent issue of the "London Gazette." The medal will be of two classes, which shall be designated and styled the Edward medal of the first and second class. The first will consist of a circular medal of silver with His Majesty's effigy on the observe, and on the reverse a design representing the rescue of a miner, with the inscription "For Courage." The second medal will consist of a circular medal of bronze of similar design. The new medals will only be awarded to those who, while rescuing or attempting to rescue others, endanger their own lives, and will be made on the recommendation only of the Home Secretary. When acts of gallantry are performed by one upon whom the decoration has already been conferred, such acts may be recorded by bars attached to the ribbon.

Statistics of British steel output for the first half of 1907, compiled by the *Iron and Steel Trades Journal*, show an advance in both the great categories of steel production. Thus the make-up of open hearth steel has increased from 2,196,853 tons in the first half of 1906 to 2,337,794 tons in the first half of 1907, while the make of Bessemer steel has increased from 919,620 tons to 1,068,-972 tons.

Some interesting information is afforded in Part II. of the General Report and Statistics Relating to Mines and Quarries for 1906, a recently issued blue book. Here we find that the total value of minerals raised in the United Kingdom during the year amounted to £105,842,992, a considerable increase over 1905, largely attributable to the increased output and advance of price in coal, whereof no less than 251,067,628 tons, valued at £91,529,-266, was produced. The output of iron ore showed an increase ployed under the Quarries' Act at mines and quarries during the of 909,703 tons, while increases are also reported in the production of copper, lead and tin. The total number of persons em-year was 1,004,092. The loss of life from accidents was 1,275.

In a book, about to be published by *The Mining Journa* (London), entitled "A Key to Cornish Mining," the author, Mr. E. W. Meyerstein, postulates: (1) That no mine has ever been worked out; (2) the deepest mine in the country, after 150 years, has only attained a depth of 3,000 feet, and there finds ore far above the average grade of the country; (3) that the majority of mines have only been scatched, and that at shallow depth.

GERMANY.

A Consular report states that Germany lays claim to the largest labor organization in the world, embracing as it does over four hundred thousand workers, and includes practically every branch of the metal-working industry. Last year this vast union collected funds to the amount of £376,000.

NORWAY.

The British Consul at Christiania reports that the Sydvaranger Iron Company, which owns large iron areas in South Varanger, are building a railway to the port of Kirkenas, where ore will be loaded into ships' holds. The ore to be exported will be treated by the Gustaf Gronsberg process. The present average metallic content is 37 per cent., but by this process it will be made into briquettes ranging from 66 to 68 per cent. iron. Arrangements are being made for a production of from six to nine hundred tons annually.

SPAIN.

The directors of the Rio Tinto have issued an interim report upon the company's operations during the current year. This states that the deliveries of pyrites have been rather below the average in the United Kingdom, but that continental consumption has been higher. Notwithstanding the scarcity of water from prolonged drought, the company's output of fine copper will be only from one to two thousand tons short of the 1906 production. The directors have declared a dividend for the half year ending June 30th of 2s. 6d. per share on the 5 per cent. preference shares, and an interim dividend of 47s. 6d. per share, free of income tax, on the ordinary shares, payable Nov. 1st.

UNITED STATES.

The report of the Alaska-Treadwell Company for the year ending May 31st last shows net earnings of $625,595 from 702,953 tons milled. The total receipts per ton are given as $2.2658, while costs are shown as $1.3759. The average assay value of the ore is $2.42, and the average saving $2.15. The mine development included 197 feet of sinking and 9,200 feet of other development work. The estimate of ore reserves aggregates a tonnage of 4,-982,883, including broken ore in stopes. The company has two mills, one of 240 stamps and the other of 300 stamps. The loss

of quicksilver in amalgamation was 35.2 per cent. in the 240 stamp mill and 32.5 per cent. in the 300 stamp mill. The average number of men employed was 493.3, and the average wage paid $3.23 per day.

The condition of the copper market is responsible for the suspension of operations in the erection of the large copper smelter at Coram, Shasta County, California, which had almost been completed. In Butte conditions seem to have settled down, the miners having agreed to a reduction of fifty cents a day in wages.

At Elko, in Nevada, a revival of interest in gold properties, the result of recent rich finds, has, it is said, set in after nearly a quarter of a century of inactivity.

The Amalgamated Republic Mines contemplate the erection of a large customs mill in Republic camp, Washington, designed to treat these ores economically by a special process. As much Canadian capital is invested in the mines of this district, this information should prove of interest to many of our readers.

The official returns of gold and silver production in the United States for the year 1906 show a gold yield valued at $94,373,800 and a production of silver of 56,517,900 fine ounces, valued at $38,256,400.

According to advices received by post at Victoria, B.C., the miners and smelter employees of the Alaska Smelting & Refining Company, at Hadley, Alaska, recently seized the company's property to enforce the payment of wages in arrears. An explanation is offered that in consequence of the decline in copper and the demands of creditors it became necessary to appoint a receiver. The liabilities of the company are $350,000. The assets include the smelter and copper mines at Ketchikan and in British Columbia.

The zinc ore production of New Jersey for 1906 amounted to 361,330 tons, constituting a record achievement in this respect.

SOUTH AFRICA.

The gold production of the Transvaal last month is estimated to have been 550,000 ounces, as compared with 538,000 ounces, the official returns for September.

Mr. J. B. Robinson, a South African magnate, recently expressed his views on the Transvaal labor question to a Reuter's representative. In this gentleman's opinion the labor supply for the mines will be ample, the Government having arranged to bring natives from Natal, while the Cape Colony is also in a position to supply labor. Mr. Robinson also stated that the mining industry had never been in such a favorable position as it is today, notwithstanding that there are now some 190 mines standing idle. Considerable discussion has, meanwhile, taken place, as to the possibility of economically increasing the number of white miners, it being proposed that one white miner at 30s. per shift be placed in charge of five or six machines, each manned by one white runner at 10s. for four holes and 2s. 6d. per extra hole. It is stated that as compared with Kaffir labor the efficiency should increase 25 to 50 per cent., and the cost per ton would then be lower.

The Transvaal Government has decided to work the new tin field in the district of Pietersburg itself, in order to give employment to white labor requiring it. The line of the tin-bearing zone extends for a considerable distance across the tops of range of granite hills called Macapaan. The metal occurs in aplite and in the coarser grained granite. Ore is at present being hand sorted and anything over 30 per cent. tinstone shipped to England.

CONGO.

An official report issued by the State comprises some interesting information on the mineral resources of this area. It is stated that in the Katanga district, at the southeastern portion of the State bordering on Rhodesia, and elsewhere, enormous belts of copper and iron have been discovered, as well as large deposits of tin. While the occurrence of gold, platinum and mercury is also reported.

NEW ZEALAND.

The report of the Department of Mines for the year 1906 places the value of New Zealand's mineral yield for that year at £3,871,811, an increase of half a million sterling compared with 1905. This satisfactory showing was chiefly due to an expansion of the gold mining industry in general and of the increased production of the Waihi gold mine in particular. Dredging operations, however, seem to have been carried on rather less extensively, and it is stated hydraulic sluicing and elevating have in many instances replaced bucket dredging. The number of dredges at work at the end of last year were 167. The average cost of dredging in the southern districts is given as about 1 3-4 d. per cubic yard, and on the west coast 2d. New Zealand's production of coal was 1,729,536 tons, chiefly bituminous or semi-bituminous in character. The number of persons employed in the industry was 12,408.

Company Notes.

The cutting of the Consolidated Mining & Smelting Company's ten per cent. dividend in half has necessitated similar action by the Canadian Gold Fields Syndicate, which owns some 4,000 shares of Consolidated, and has been paying out of its receipts from the Consolidated 7 per cent. It will hereafter pay half that in quarterly payments.

The first annual meeting of the Green-Meehan Mining Company was held on Saturday. The balance sheet showed $5,292.95 cash on hand. In reply to a question it was stated that $325,000 had been paid for the property in the first place by the present company, and of this $250,000 was cash. Instead of the 40 acre claim only 33 acres had been procured. It was decided to cancel the 1,000,000 shares of stock held in the treasury, making the new capital stock $1,500,000. The board of directors was re-elected. Manager O'Connell stated that owing to the delay in delivering machinery the development work of the mine had been greatly retarded. The present plant is valued at $21,676.15.

The balance sheet presented showed:—

ASSETS.

Cash on hand and in bank	$5,292.95
Accounts receivable	193.04
Unearned insurance	172.15
Supplies	658.67
Power plant, buildings and equipment, including buildings, equipment, power plant, tools, office furniture, etc., etc.	21,676.18
Development	6,626.94
Mine Location No. 60	1,299,955.00
Trust stock in treasury	185,000.00
	$1,519,574.93

LIABILITIES.

Accrued wages, payable November 9		$1,284.60
Capital stock originally issued	$2,500,000.00	
Less stock held for cancellation	1,000,000.00	1,500,000.00
Profit and loss account		18,290.33
		$1,519,574.93

ANNOUNCEMENT.

The Birmingham branch office of the Sullivan Machinery Company is now located at number one Twentieth street, south, instead of at number twelve, as heretofore. Additional space is thus provided for Sullivan mining and quarrying machinery carried in stock at this office.

STATISTICS AND RETURNS.

British Columia shipments, week ending October 26th:—
Boundary shipments—Week, 31,354; year, 1,049,156.
Rossland shipments—Week, 6,281; year, 234,801.
Slocan-Kootenay shipments—Week, 3,725; year, 123,240.
The total shipments from the mines in the above districts for the past week were 41,360 tons and for the year to date 1,397,197 tons.

CROWS NEST PASS COAL COMPANY.

The output of the collieries for the week endinf October 25th was 21,996 tons; daily average, 3,666 tons.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Nov. 9. Ore in lbs.	Since Jan. 1 Ore in lbs.
Buffalo	40,000	2,138,830
Coniagas	.....	4,622,820
Cobalt Central	.....	101,360
Colonial	.....	74,250
Drummond	.....	108,920
Foster	.....	513,396
Green-Meehan	.....	196,790
Hudson's Bay	.....	45,170
Imperial Cobalt	.....	37,530

The total shipments for the week were 954,000 pounds, or 477 tons. The total shipments since January 1, 1907, are now 22,003,406 pounds, or 11,001 tons.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending November 2nd was 21,172 tons, a daily average of 3,529 tons.

The output of the collieries of the collieries of the Crow's Nest Pass Coal Company for the week ended November 8th totalled 22,115 tons, a daily average of 3,686 tons.

COPPER EXPORTS FOR OCTOBER.

The exports of copper from the United States for the month of October were the next largest on record, amounting to 28,786 tons, the largest being in January, 1904(when they totalled 29,085 tons.

A leading copper producer figures that the total sales of copper by all companies and agencies over the last four or five weeks aggregated between 200,000,000 and 250,000,000 pounds, most of which was purchased by foreign dealers. Of the total amount the United Metals Selling Company sold between 100,000,00 and 125,000,000 pounds.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Oct. 26. Ore in lbs.	Since Jan. 1 Ore in lbs.
Buffalo	60,000	2,058,830
La Rose	309,538	1,908,100
Trethewey	64,680	1,594,688

The total shipments for the week were 434,218 pounds, or 217 tons. The total shipments since January 1, 1907, are now 20,522,093 pounds, or 10,261 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2144 tons, valued at $1,473,196; in 1906, 5129 tons, valued at $3,900,000.

DOMINION COAL OUTPUT.

The output of the Dominion Coal Company's collieries for the month of October was 3422,469 tons, or ahead of any month in the year, and only exceeded once last year, when the October output wah 350,000 tons. The showing is some 50,000 tons better than in September. Comparative figures by months:—

	1907.	1906.	1905.
January	252,248	231,606	160,612
February	226,190	225,716	128,778
March	203,194	310,220	228,765
April	316,384	296,417	221,541
May	328,947	323,777	294,647
June	319,560	325,911	332,926
July	314,559	318,291	329,164
August	316,633	327,734	329,172
September	295,058	323,733	322,288
October	342,469	350,000	333,317
November	.....	308,367	303,440
December	.....	206,884	211,877
Totals	.....	3,248,565	3,196,527

Philadelphia.—The anthracite production in October was 6,015,551 tons, as compared with 5,384,768 tons in October last year, an increase of 530,783 tons. This is the largest month's production.

Nelson, B.C.—Following are the ore shipments and smelter receipts in Southeastern British Columbia for the week ending November 2nd and year to date in tons:—

Ore shipments—	Week.	Year.
Boundary	39,701	1,079,857
Rossland	6,197	230,998
East of Columbia	3,699	131,689
Totals	40,497	1,442,544
Smelter receipts—	Week.	Year.
Grand Forks	20,739	595,147
Greenwood	7,150	290,158
Boundary Falls	.....	158,394
Trail	7,955	213,588
Nelson	.....	11,340
Northport	2,204	82,605
Marysville	600	26,400
Totals	28,648	1,377,622

RAND GOLD OUTPUT.

Gold production of the Transvaal last month, as estimated by Kaffir houses in London, was 550,000 ounces, fine, against 538,000 officially announced for September. Value of the October output, calculated on the basis of the above estimate, compares as follows: October, 1907, $11,687,000; October, 1906, $11,422,000.

COPPER STATISTICS.

Copper exports from the United States for ten months this year according to Government returns, have been 156,689 gross tons, equivalent to 351,000,000 pounds, approximately. Total consumption in the United States for ten months is estimated at 440,000,000 pounds, making a total consumption of 791,000,000 pounds. Total production for the month is figured at about 682,000,000 pounds.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Nov. 2.	Since Jan. 1
	Ore in lbs.	Ore in lbs.
Buffalo	40,00	2,098,830
Foster	66,000	513,306
La Rose	249,870	2,157,970
McKinley-Darragh	120,000	891,240

The total shipments for the week were 475,870 pounds, or 237 tons. The total shipments since January 1, 1907, are now 21,049,406 pounds, or 10.524 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2144 tons, valued at $1,473,196; in 1906, 5129 tons, valued at $3,900,000.

COBALT'S OCTOBER OUTPUT.

The shipments from Cobalt camp for the month of October have been almost a record.

For September last the output from the camp was 760.5 tons, while for the month of October it was 1,174.56 tons, or an increase of 414.06 tons. The shipments for the month were as follows:—

	Tons.
La Rose	432.51
McKinley-Darragh	351.62
Buffalo	120.00
Trethewey	91.83
Coniagas	32.50
Drummond	32.31
O'Brien	32.30
Nipissing	30.50
Kerr Lake	29.99
Townsite	21.00

The total output from Cobalt camp for the first ten months of this year is 10,924.65 tons, or a monthly average of 1,092.46 tons.

METAL, ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.

Antimony—9 1-4 to 11 1-2 cents per lb.

Arsenic, white—6 7-8 to 7 1-4 cents per lb.

Barytes, crude—$18 to $20 per short ton.

Bismuth, metal—$1.75 per lb.

Cadmium, metal—$1.50 per lb.

Carbons for drills—$70 to $90 per carat.

Carborundum, powdered—8 cents per lb.

Chromium, metal pure—50 cents per lb.

Cobalt, f.o.b., Cobalt, Ont., unrefined—30 to 40 cents per lb.

Corundum—7 1-2 to 10 cents per lb.

Feldspar, ground—$10 per short ton.

Flourspar, lump—$8 to $13 per long ton.

Graphite, domestic—$50 to $150 per ton.

Gypmsum, lump—$7 per short ton.

Infusorial earth, ground—$15 to $30 per ton.

Manganese, pure metal—75 cents per lb.

Mica, ground—$45 to $75 per short ton.

Mica, scrap—$10 to $15 per short ton.

Molybdenum, pure—$1.70 per lb.

Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.

Nickel, metal—45 cents per lb.

Platinum, ordinary metal—$26.50 per ounce.

Platinum, scrap—$19 per ounce.

Pyrite—10 to 11 3-4 cents per unit for 38 to 45 per cent. sulphur, lump ore or fines.

Quicksilver—$45 per 75 lb. flask.

Sulphur—$10 to $21 per long ton.

Talc—$15 to $30 per short ton.

Tungsten, pure metal—$1.30 per lb.

Tungsten, ore, 60 per cent. pure—$9.50 per unit.

MARKET NOTES.

Silver.—October 17th, 60 7-8 cents; October 18th, 60 cents; October 19th, 60 cents; October 21st, 61 1-8 cents; October 22nd, 61 1-2 cents; October 23rd, 61 5-8 cents; October 14th, 61 3-8 cents; October 25th, 61 cents; October 26th, 60 1-4 cents; October 28th, 60 1-2 cents; October 29th, 59 1-8 cents; October 30th, 59 1-8 cents; October 31st, 59 3-8 cents; November 1st, 59 1-4 cents; November 2nd, 59 7-8 cents; November 4th, 60 1-8 cents; November 6th, 60 5-8 cents.

Mexican dollars, 47 3-4 cents.

Sterling exchange, $4.8575.

Copper.—Since October 17th lake copper has fluctuated between 11 3-4 cents on October 23rd and 15 cents on November 6th. More business is doing, but the market is still very quiet. New York, lake, 14 3-4 cents; electrolytic, 14 cents. London, £63 12s. 6d. for spot.

Spelter.—Market quiet. New York, 5.10 to 5.15 cents; London, £21 15s.

Lead.—Lead is steady at 4.75 cents, New York; London, £18 for Spanish.

Tin.—New York, 30 1-2 cents per lb.; London, £138 10s. for spot. Market weak.

Pig Iron.—No. 2 foundry quotes at $21, Pittsburg. Basic iron, $19.

SOUVENIR HAND BOOK

THROUGH

COBALT, SUDBURY AND MOOSE MOUNTAIN

OWING to the extreme care necessary in handling the colour press work in printing this volume the publishers have been unable to bring it out as soon as was hoped. It is now ready.

Orders have been received for a large number. It is probable that a second edition will have to be printed. The publishers will consider it a favor if intending purchasers will send in their orders as promptly as possible. In this way the need of a second edition can be determined early.

For Business Buildings

The only cleanly, the only fire-proof ceiling —the ceiling that says the last word in decorative beauty,—the ceiling that shows no seams—that will outlast the building itself

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the anadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47 50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory

Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run,

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory They are prepared to fill your order with all possible despatch If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers kindly mention this Journal.

SYNOPSIS OF CANADIAN NORTH-WEST MINING RECULATIONS

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Underwood

The Underwood Condensed Billing Typewriter describes itself in its title. An invoice (and as many carbon records as may be required) as well as the salesbook entry, are made at the one writing.

The salesbook entries are made on a long sheet, and are condensed, eliminating all waste space. Both sides of the sheet are utilized; disintegration columns may be added to the right of the total column upon the sales sheet, in which sales can be classified according to departments or ledgers.

We have an interesting catalogue which illustrates and fully explains this, and the other special Underwood bookkeeping machines. It is worth the trouble of asking for it.

United Typewriter Co., Limited, Adelaide St. East, Toronto
And in all the principal Cities.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

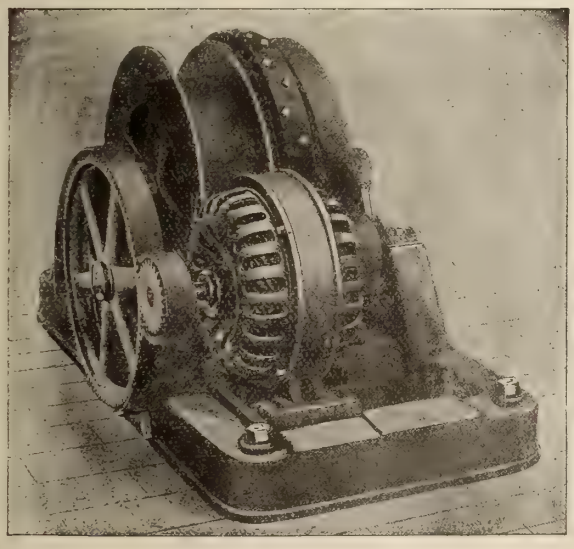
$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.



Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

Sullivan Rock Drills

Sullivan "UF-2" (3¼-in. Rock Drill at work on a high face of ore in a Joplin "Sheet Ground" Mine.

In the Joplin Lead and Zinc District of South-Western Missouri

Sullivan Drills are extensively used under all conditions of service. The experience of a large number of operators, covering several years past, shows that Sullivan Drills have a greater drilling capacity, and cost less for maintenance, than any other drill used in the district.

This fact, of which there are many specific instances, is due to the simplicity of the Sullivan Drills, and to the excellence of their construction and component materials.

Mining work in the Joplin district is described in an especial article in the current

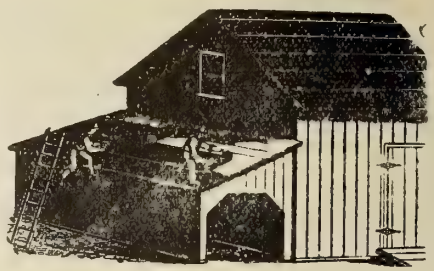
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

Leading Features of a Good Rock Drill

No. 5.—General Efficiency

Testing a Rand Drill.

ACTUAL Results in rock drilling vary so much, according to the character of the rock drilled, that it is impossible to state just what a machine will do. For instance, 30 feet of holes would be a good days work for our $3\frac{1}{4}$" drill under certain conditions, but under other and more favorable conditions it has drilled 200 feet a day. Our $3\frac{5}{8}$ drill has drilled holes 50 feet deep while in some cases they are being used for 6 foot holes.

Our Point is this:---We cannot state just what our drills will do, but we do *guarantee* any size of our "Little Giant" to *do more work* in a given time than the corresponding size of any other make.

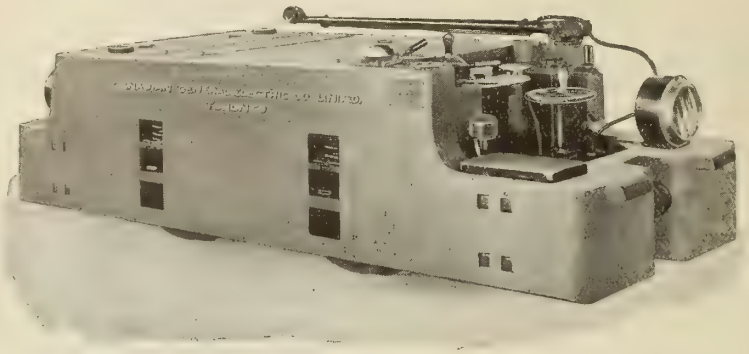
McGill University
MONTREAL

The Curriculum comprises courses in Arts, Applied Science (Civil, Mechanical, Electrical and Mining Engineering, Railways—Theory and Practice, Metallurgy, Practical Chemistry and Architecture), Law and Medicine.

The courses in Arts, Applied Science and Law are open to Partial Students without Matriculation.

The courses and degrees in Arts are open to women on the same terms as to men. Board and residence are provided in the Royal Victoria College—a residential hall for the women-students of the University. Instruction in music is also provided in the McGill Conservatorium of Music.

Matriculation Examinations preliminary to the various courses of study will be held at Montreal, and at local centres commencing June 12th, and at Montreal 9th September.



A number of First Year Entrance Exhibitions in Arts, ranging from $100 to $300 in value, are offered for competition in June, and a number of Second Year Entrance Exhibitions, and Third Year Scholarships, tenable for two years, will be offered for competition in September.

Particulars of Examinations and copies of the Calendar containing full information may be obtained on application to

THE REGISTRAR,
McGill University, Montreal.

THE BEGINNING OF THE END.

A HISTORY AND A MORAL.

When the CANADIAN MINING JOURNAL began its its open attack upon fradulent promotions, a speedy victory was not expected. But, owing to the prompt and most creditable action of the Ontario Government, the situation has been cleared and a precedent of extraordinary significance has been established.

It was recognized from the first by those chiefly concerned in conducting the anti-wild-cat campaign, that the offending companies were organized for the especial purpose of evading the letter of the law.

Also it was recognized that human ingenuity could not construct a law that dishonest persons could not evade. It was then concluded that since the Ontario Companies Act is as clearly expressed and carefully constructed as can well be expected, and since this Act was being both evaded and disregarded, therefore it was necessary to see that not the letter alone, but the spirit of this Act be respected and observed.

The firm of Law & Company was chosen as the first point of attack for two reasons—it had erected already one monument of falsehood, "Silver Bird"; and its advertisements were fast becoming a public nuisance.

For several reasons it was thought wise to begin proceedings by laying information against Law & Company for breach of the provisions of the Companies Act. A criminal action for fraud could even then have been instituted. This, however, would have entailed delay and trouble and would not have served our purpose so directly.

The Provincial Secretary's Department at once acted upon the information laid and commenced proceedings against Frank Law. Law's associates, Russell and Abendroth were served with subpoenas. Russell promptly left for England.

After frequent hearings in the Police Court, during which most damaging evidence, bearing on Law & Company's methods, was heard, the Government decided to institute criminal proceedings. Accordingly on Monday afternoon, November 18, Frank Law was placed under arrest. The arrest was made in the Police Court just as an adjourned session of the trial under the Companies Act was beginning.

All relevant papers, and documents were immediately removed from Law's office. Law himself was given freedom on ten thousand dollars bail, exclusive of his personal securities. Meanwhile Russell, who is included in the indictment, is supposed to be on his way back from England.

Up to the date of writing Magistrate Kingsford has not given a decision on the Companies Act case.

A few days after the Companies Act case was begun, Law & Company started proceedings against the CANADIAN MINING JOURNAL for libel and prayed for an injunction against us. The injunction was refused by Chief Justice Meredith. Whether the suit against the JOURNAL is or is not proceeded with is immaterial. The present result amply justifies our position.

The principals of Law & Company now stand charged with fraud in connection with the flotation of Silver Bird, Blue Bell, Lucky Boys and Highland Mary. The Crown Attorney possesses all essential documents.

For the benefit of the public we give the following facts: Frank Law, the head of the firm of Law & Company, was, about four years ago, a barber in Montreal. Graduating from life insurance he started his present business in Toronto not more than a year ago.

With these qualifications for guiding the public in mining instruments he, or his firm, has abstracted a goodly number of dollars from innocent victims.

The above is a mere skeleton of the history of our efforts to bring Law & Company to justice. In themselves Law & Company need not be mentioned again. We shall be glad to drop the unclean subject.

But the episode has brought into light some important truths.

Foremost of these is this—the Ontario Companies Act is a comprehensive and sufficient piece of legislation. Second and, of as great importance, is the consideration that the Ontario Government can and will administer that Act as it should be administered. Of even greater future significance is the fact that the Government, in taking criminal action against Frank Law, shows that it is determined to stamp out improper mining flotations.

Ontario is no longer a breeding place for wild-cats. The Provincial Government has created a precedent that will swiftly and surely kill the entire breed. It is true that the Government did no more than its duty; but it is not every Government that will cheerfully accept its moral responsibilities.

Ever since the first days of Cobalt's boom the mining fakir has waxed fat. The Canadian public has swallowed tales of treasure-trove, compared with which the Arabian Nights are anemic and Captain Kidd's history but a pale anagraph. The bait has been taken. Latterly the barb has made itself felt. We hope, we believe, that the lesson has been taken to heart, for a time at least.

And now for the inevitable moral. If Canadians, with money to invest in mines or prospects, wish to go about it in a sane, profitable way, there is but one course. In Canada there are now a large number of especially trained, honest and capable mining engineers. McGill, Queens and Toronto are graduating some dozens every year. These men have made it their business, their life work, to learn about Canadian minerals, how they are found, how they are won and how they are made into commercial products.

The services of these men are procurable. As mining engineers they practice a profession at once honorable and arduous; a profession demanding broad mental development and more than average physical stamina. They have spent years of preparation. They must, from the nature of their work, undergo hardships that no other professional men are called upon to endure.

The title of mining engineer, properly won and properly worn, implies high technical skill added to scrupulous honesty.

These then are the men, products of our own universities, or of universities of equal standing, by whom the Canadian public should hereafter be guided in mining affairs.

One word on a delicate subject is necessary before concluding. There is a vague, though general, impression current that when a mining engineer asks a substantial fee for making an examination of a mining property, he is setting an exorbitant price upon his services. A little thought will correct this error.

The independent mining engineer is the product of an expensive education and of a more expensive practical training. Work with him is not usually continuous. There are long idle periods to be reckoned upon. This is one controlling factor.

Another is that the examination of a mine, or even a prospect, is almost always an expensive thing in itself. More especially is this the case in Canada. The taking of samples, the making of plans; the collecting and coordinating of data geological, mineralogical and metallurgical; the investigation of conditions of labor, market, transportation, fuel supply, water supply, are responsible and laborious work. A favorable report from a good engineer transforms commercially worthless ground into a negotiable asset. This must be kept in mind by the owners of mineral lands. The advice of a mining engineer at the right time may save much useless expenditure; also, the imprimatur of his approval may multiply the value of a claim many times.

As a corollary to its wild cat campaign THE CANADIAN MINING JOURNAL intends to begin at once a series of sketches of the leading mining engineers practising in Canada. Whenever possible portraits will accompany these articles. Neither sequence of seniority nor alphabetical order can be followed. But we hope to cover the whole field.

We have chosen this course deliberately as a constructive antidote to the mining fever and as the best preventive of a recurrence of a wild cat plague.

That Cobalt has lived through over-capitalization and manipulation is evidence of the camp's solid worth. The total output of 1907 will be gratifyingly larger than that of previous years. The present depression is forcing upon managers and directors the necessity of curtailing expenses. The attitude of the American smelters compels shippers to look around for other markets and to

begin the erection of Canadian smelters. These conditions will help to bring about important changes in Cobalt itself. That the camp is a rich one is unquestionable. But not until recently has it been so obviously necessary to adopt economical methods. Thus the depression of stocks and the scarcity of money will undoubtedly prove blessings. Cobalt put upon her mettle will do better than Cobalt hysterical.

It is not improbable that our attacks upon dishonest financial methods may, indirectly, do harm to Cobalt in general. We therefore wish to indicate plainly that of Cobalt's present worth and future success we entertain only the most favorable opinion.

A NIGHTMARE.

The *Mining and Scientific Press* of San Francisco in its issue of November 16th, prints a letter entitled "The Wild Cats of Ontario." It is dated from New York and is signed "D.A."

The letter suggests that THE CANADIAN MINING JOURNAL should expose what "D. A." is pleased to call "the Ontario conspiracy." "This," the writer explains, "is a gigantic conspiracy among the people of Northern Ontario to spread, and pretend to believe, the false reports emanating from irresponsible prospectors and fortune hunters."

The writer continues in this strain. Like Tomlinson, he repeats several things that he has been told, all of them extremely damaging to Cobalt and Ontario.

The specific statements concerning the Silver Queen, O'Brien, McKinley-Darragh and La Rose are untrue. They are based upon the cheap stories that cheaper male gossips circulate in every mining camp. Mostly these stories are created and repeated to give a fictitious importance to the teller. Neither "D. A." nor any other foolish person of his kind is in a position to know the facts about the mines mentioned.

If the "gigantic Ontario conspiracy" needs refutation at all it can be met by the one fact that THE CANADIAN MINING JOURNAL has received hundreds of letters from the engineers, miners, prospectors and mine owners of Northern Ontario, offering all assistance in the work of extirpating frauds and fakirs.

We doubt, however, if any person who has visited Northern Ontario could be induced to take "D. A." seriously.

It is the fear that this totally unwarranted letter may damage Cobalt in the minds of American readers that leads us to notice it.

There is no need of descending to the methods of wild cats in dealing with them. But "D. A." is quite as untruthful as the worst of these felines.

Repeating what we have said on another page, a sufficient answer to all such calumy has been made by the Ontario Government. The Government has set its face definitely and resolutely against mining frauds. In this it has also set an example that "D. A.'s" own country could not do better than follow.

THE CONSOLIDATED MINING AND SMELTING COMPANY.

The payment of a November dividend by the Consolidated is a pleasant offset to other and discouraging reports from British Columbia. The company has an issued share capital of $5,355,200, divided into 53,552 shares of $100 each. This last quarterly dividend amounted to $133,880. This is the seventh dividend disbursement at the rate of ten per cent. per annum.

The Consolidated is an example of the benefits of selective amalgamation. Under its control are the War Eagle and Centre Star groups of mines in the Rossland district; the Eureka group at Sandon; the St. Eugene at Moyie; and the Snowshoe group at Phoenix. The Trail smelter is also the company's property.

There are undeniable advantages in consolidation. The fortunes of a company, whose interests are not confined to one district are less susceptible to ordinary vicissitudes. The failure of one mine does not necessarily imperil their whole enterprise.

On the other hand, there is a needless duplication of work in mining districts where many mines are operated by single individuals or companies. In Germany this has been recognized. By a loose, but efficient, association of interests the owners of coal and iron mines, the blast furnace companies and the steel corporations work together. Orders for iron and steel are distributed and allocated by the central offices of syndicates. All matters pertaining to transportation are dealt with by specially trained experts. In fact the individual producers of ore, coke, pig iron or steel are relieved of much of the incidental troubles that so militate against similar operators in Canada. The German producer is assured of his raw material at a fixed rate and of a sale for his product.

To a certain extent like benefits accrue to the members of any well organized consolidation.

This is not a panegyric on trusts. It is merely an amplification of the old saw, that in union there is strength.

NOVA SCOTIA AND THE JAMESTOWN EXPOSITION.

Nova Scotia's exhibit of gold ores has won highest distinction at Jamestown. This is gratifying. Upper Canadians are ignorant to an amazing degree of the mineral wealth of Nova Scotia. In Boston and New York her resources are better known. But throughout both Canada and the United States Nova Scotia needs advertising.

We are informed that the creditable exhibition made at Jamestown was organized largely by a Virginian lady, who is interested in a Nova Scotian mine. Part

of the exhibit is the personal property of Mr. A. A. Hayward, past president of the Nova Scotia Mining Society, and late manager of the famous Golden Lode mine.

It is but a matter of time when Nova Scotia's gold fields will come to their own. They have passed through two stages—one of early crude methods and one of mismanagement. With improved methods and a better understanding of the geological phenomena, Nova Scotia will presently lead all Canada as a gold producer.

A GOOD MOVE.

The Ontario Bureau of Mines has engaged Mr. G. C. MacKenzie to look into the adaptability of various methods of magnetic concentration to the iron ore deposits of the Province. Mr. MacKenzie's instructions are, as they should be, general. Electric smelting, magnetic cobbing, magnetic concentration and kindred processes will be investigated. Then will follow a thorough examination of the extent, nature and availability of many iron ore deposits hitherto considered unworkable.

The Bureau of Mines is acting with wise prevision in this. The advance of science is rendering valuable ore bodies that ten years ago were worth nothing. Undoubtedly also electric smelting is the process of the near future, especially in a country where water power is cheap and abundant.

The choice of Mr. MacKenzie is a good one. Mr. MacKenzie is a graduate of Kingston School of Mining. Though a young man, he has had wide experience in mining. He is a proficient iron metallurgist. Thus he is well fitted to conduct this very important investigation.

The results of an enquiry so complicated and of such immediate significance will be looked for with eagerness, not only in Ontario but throughout the whole of Canada.

The investigation, we take it, will not be confined to the commercial aspects of the question, but will in addition deal with the present condition and future promise of electro-metallurgic processes of reduction and, more especially, with the comparative merits of magnetic concentration methods. On these subjects there is a large and constantly increasing series of monographs. This literature constitutes a valuable starting point for the investigator. Indeed a careful summary of literature already published would form an excellent introduction to the final report.

THANKS.

The *Mining Reporter,* November 14th, makes appreciative mention of The Canadian Mining Journal's attitude towards questionable mining schemes. We are grateful for this. Coming from such a source, appreciation is significant. The *Mining Reporter* is one of a number of American periodicals whose whole influence is for good. The United States is by no means free from fraudulent mining promotions. But the educative and moral power of clean technical journals has done very much to restrict wild cats. Indirectly, by the dissemination of knowledge; directly, by exposing fraud, the technical press has performed a high mission.

A THREE CORNERED ROW.

Three of our contemporaries on the other side of the line have been indulging in a little squabble as to the errancy of copper statistics. Witnessing the fray from afar, we would award the victory to the *Mining and Scientific Press.* Our Chicago contemporary, the *Mining World,* lays claim to inerrancy and infallibility. These claims the *Press* punctures with all the surgeon's pleasure in a perfect incision.

Only two disputants were involved at first—the *Engineering and Mining Journal* of New York and the *Mining and Scientific Press* of San Francisco. The *World* "butted in" (that phrase is used advisedly) with results disastrous to itself. The *Press* has a long, sharp sting. It used that sting on the *World.* Our metaphors may be mixed; but we await eventualities with fervent interest.

NOMINATIONS.

At a well attended meeting of the Toronto Branch Dr. W. G. Miller was nominated for the presidency of the Canadian Mining Institute. A similar nomination, signed by a large number of members, was also sent to headquarters in Montreal from Cobalt. The Toronto Branch has also nominated Dr. A. E. Barlow for the position of vice-president, and Mr. J. B. Tyrrell for councillor. It would be hard to select three more fitting men.

Editorial Note.

A government laboratory is an asset of tremendous value. The Quebec Government, although it possesses no laboratory of its own, has had an arrangement with Mr. Milton Hersey, of Montreal, whereby prospectors and others can have all varieties of mineral samples assayed and analyzed at very moderate rates. Qualitative examinations are made for the nominal fee of twenty-five cents. Incidentally it may be remarked that the qualitative examination is far more useful than is usually recognized. An assay or a quantitative estimation is often misleading for the reason that the original samples are not representative. A laboratory, conducted by a chemist whose reputation is established beyond question, no doubt appeals to the public more than an enterprise controlled by the Government.

THE CARIBOO-McKINNEY MINE.

The old Carriboo-McKinney mine, at Camp McKinney, B.C., about twenty-seven miles west of the Granby mines at Phoenix, is once again being operated, after having been closed down for several years. A syndicate of Phoenix people, yclept the Cariboo-McKinney lessees, about a year ago leased and commenced work upon the property. Following is a list of the officers of the Cariboo-McKinney lessees syndicate: President, R. B. Boucher; secretary, Geo. L. McNicol; superintendent, P. D. Ahier; directors, L. Y. Birnie, C. M. Campbell, William Rowe, W. S. Macy and A. B. Hood. The head office of the concern is situated at Phoenix, B.C.

Owing to the impaired condition of the shaft, it having been found, in the lower levels, to be full of timbers and rock intermixed, it took over six months to get the water out of the mine to the four hundred foot level. Prospecting for ore was then undertaken and after some little work what appeared to be a good body of ore was located on the two hundred foot level. Ten stamps of depth than they have now attained. It consists of sixty and eighty horse-power boilers, hoisting engine, five drills, compressor, pumps, etc. Only two air drills are being operated at the present time on the development work, and as has been stated before, the outlook is not very encouraging. However, the Phoenicians are born optimists anyway, and the lessees hope for brighter things later on.

The six claims which comprise the property of the Cariboo-McKinney are the Cariboo, Amelia, Okanagan, Saw Tooth, Maple Leaf and Emma. Supplies for use at the mine are shipped to Bridesville on the Great Northern Railway, and go from there to Camp McKinney, ten miles, by a good wagon road.

The authorized capital of the Cariboo-McKinney Company is $1,250,000, par value of shares $1 each. The company has paid $546,837 in dividends to date, the last dividend having been paid the shareholders in February, 1904, which only amounted to four cents per share. The

CARIBOO-McKINNEY SHAFT HOUSE AND COMPRESSOR ROOM.

the battery of twenty now on the property were fixed up and two hundred tons of this ore was put through the mill, but when the clean-up was made and a gold brick turned out it was found that the values saved from the ore taken from the two hundred foot level were not sufficient to mine and mill it and pay a profit, so the lessees have closed down the mill and at the present time are prospecting for a better grade of ore. I am informed from a reliable source that up to the time of this writing there is no ore in sight that is worth taking out of the mine. Some of the ore which they have encountered runs from $3 to $12 per ton, and there are pay streaks in this running from $12 to $31 per ton. Of course prospecting a mine like the Cariboo is somewhat of a gamble, and at any moment the miners are apt to encounter exceedingly rich ore, a very small body of which would put a lot of money into the pockets of the lessees.

There are now only about twelve men working in and around the mine. The property is equipped with a mining plant of sufficient capacity to mine to a greater

shares, which sold considerably above par eight or ten years ago, and around 36 cents per share five years ago, can now be secured for about four cents per share.

Al. McKinney, now nearly broke and dying of cancer on a small farm in Washington State, with some other prospectors, leaving Colville, Wash., in the spring of 1887 and going up into the Creek district, passed through the placer workings that were then being operated there and going along the ridge dividing the North and South Forks of Rock Creek came to the bare spot where now lies the Cariboo. Here they found decomposed quartz with the free gold plainly visible in it. The Cariboo claim was staked on the discovery, but the discoverers made a mistake in supposing that the vein ran north and south and staked the claim in that direction, the claim being 1,500 feet by 600 feet, as required by the laws in force at that time. McKinney and another prospector each owned a moiety in the Cariboo, and one of their partners, "crying" because he was not in on the deal, was appeased by McKinney showing him what appeared

to them a parallel vein to the east of the Cariboo. But this other man was from Patagonia, and McKinney had to take a pan of the decomposed rock to the creek and pan out the gold before he would believe. The pan of dirt ran $2.50, and so the Amelia was located at the same time, "doubting Thomas" and the other prospector getting in on the ground floor.

In 1887 McKinney sold his interest in the Cariboo to a Spokane syndicate, among whom were James Monaghan, Geo. B. McAuley and Clement King, for about $7,000. However, the Spokane people were not in a much better position to operate the property than McKinney and his partners, so it still lay idle. Finally in 1894 Monaghan secured a second-hand milling plant on a long credit, and, arranging with his miners that they should depend on the proceeds of the mine for part of their wages, he started to work. The Cariboo paid handsomely from the moment the first stamp dropped, which was on April 24th, 1894.

Several years afterwards Monaghan sold most of his stock for sixty cents per share, and the money from the sale of these shares, together with what he had received in profits from the mine, amounted to nearly $400,000.

From 1894 to the time when it closed down a few years ago, the Cariboo mine produced something over two million dollars altogether.

McKinney and the money he got for his interest in the Cariboo were eventually parted, and once again he turned towards the rugged hills, his heart filled with the sempiternal hope of the prospector, searching for another of nature's treasure deposits, but he has never since made a find to compare with the Cariboo. Recently when in the Hope Mountains, on what McKinney knew to be his last prospecting trip, when he was making a final effort to leave his daughter a competence, he fell exhausted and would have died a lonely death in the hills he loved had he not been found and brought back to where he could receive the attention he required. Such is fate!

GEO. A. OHREN.

Oct. 25th, 1907.

DIAMONDS IN ARKANSAS.

The yellowest daily journals of New York City are devoting considerable space and corresponding display to the authenticated discovery of diamonds in the State of Arkansas—a not unexpected event—though attended by the usual degree of unveracity, taking this for example:—

"Arkansas Farmers
"Desert the Plow
"For the Diamond."

"Harvest Fields Being Run by Women While Men Seach for Fortunes."

Cotton crops are spoiling, farmers are "diamond crazy." Labor is "impossible to get," male members of families "are out combing the banks of the Little Missouri in search of wealth." Such is the introduction followed in sequential order by assurances that

"There are real diamonds in Pike County and plenty of them."

"Two and a half miles south of Murfreesboro there is the crater of an extinct volcano in which occurs periodrite (a printer's error), the South African diamond-bearing rock, and up to date more than one hundred and forty stones, running in size from one to six and one-half carats have been found."

That such stones "are of the finest quality and lustre," also goes without saying, notwithstanding the writer said it. The further averment that "the crater is at least one mile in diameter" and that "ten shafts sunk within this radius have tapped the diamond-bearing rock" arouse the suspicion that "the Arkansas Traveller" is again active in amusing fictions.

It is quite possible that "a number of prospectors are working the shoals along the river bed and are getting good returns." No one will have to dispute the statement that "a few good diamonds have been found along the river bank, having undoubtedly been washed from the volcano." That is, this mile wide mine, during the period of activity as a volcano, when the point of least resistance expanded and muds and associated minerals were rushed into the vacuum, was subjected to a species of sluicing, causing "the volcano" to disseminate gems along the "shoals" and "banks." The lay writer on the subject probably mistakes the period of deposition—a minor detail, perhaps. He might be excused had he not continued thus:—

"According to the geologists sent here by the Government to investigate the diamond field, at some remote period the Gulf of Mexico extended as far north as the volcano in which the diamonds are found. During an eruption, they say, under the water, the sudden cooling of the earth, together with the great pressure, formed the diamonds. The stones are found in quantity about twenty feet below the surface and under a bed of gravel. No drill has yet been sunk deep enough to find out the depth of the peridotite."

Needless to say, the origin of these diamonds, as recounted, will astonish "the geologists" referred to, Professors Crookes and Myers, Mr. Kunz, international crystallographers, and the directorates of Kimberley and Transvaal mines. A globular crater "a mile in diameter"—seven or eight times larger than any "pipe" of payable value—and that before the characteristic containing walls of "the volcano" are defined—"licks creation." Nothing of the sort was heretofore classified among the "great expectations" of mining men. The Arkansas writer may have divined this claim area, or it may only be a measured aberration on his part. While he was at it, however, he might as well have anticipated the future ascent, and the records of the diamond drill core, which drill is to be "sunk deep enough to find out the depth of the peridotite." Having presumed as to the diameter of the circuitous crater he could have projected his hypotheses to vertical details, thereby leaving it to "rotaries" and "pulsators" to present the diamonds as their portion of the daily routine of such mining.

Because Ontario has an assortment of "experts" who bring discredit upon honorable and distinguished technical men earnestly engaged in conscientiously determining the economic worth of its mineral resources, the

advent of this Arkansas writer points a moral. He glibly refers to "diamond-bearing rock," describes the volcano forming and emitting gems like clay pigeons from a trap, obviously escaping from subterranean cold and crushing forces; yet he intimates that the depth of the peridotite is a matter of solicitude.

Ontario has evolved "gems" in the form of prospectuses. This Arkansas "expert," and whoever inspired him, will be readily conceded precedence in this regard, because a new theory and practice relating to diamonds and diamond mining are comprehensively expounded. Unfortunately, such "experts" cause "farmers" to "desert the plow"—or sell it—drive women to despair, or the furrow—and indirectly discredit scientists devoted to the determination of mining problems. For years it has been an open secret that diamond-bearing craters or "pipes" might at any moment be found on this long line of fissuring. The trouble there has been, as elsewhere, unscrupulous and improvident speculators conceived it to be a first principle, that millions worth of scrip must be issued and parcelled out among the adventurous public before a washing test was made of the diamondiferous ground. In one glaring intsance a company, capitalized at $5,000,000, with every mineral present that the Kimberley mines disclose—except diamonds—had not washed a solitary load to ascertain whether the one indispensable existed in "the pipe." Scrip at 10 cents on the dollar was put in circulation.

This Arkansas development is in danger of being involved in similar scandals, and rather than submit to such "experts," it devolves upon those responsible for cotton crops rotting in the fields, women going into the fields, men tempting the unkind Fates, to begin washing operations and publish the recovery per hundred loads. Conceding that diamonds exist in the peridotite, that their quality and lustre are superb, the question recurs:

"How many diamonds per hundred loads will be recovered from a trial washing of 20,000 loads?"

There are "blind pipes," low grade and unpayable "pipes," and "pipes" possessing diamonds in payable quantities; but a "pipe" a mile wide, with "plenty" of the precious stones, gives the palm to Arkansas—or its "expert."

ALEX. GRAY.

A WESTERN AUSTRALIAN PLANT.

In the report of the Western Australia Department of Mines for the year 1906, the treatment plant of the "Associated Northern Blocks, Limited," of Kalgoorlie, is described. This treatment plant is of the "Dry Crushing Type" and is designed to handle the sulphotelluride ore obtained from the "Iron Duke" shoot.

The treatment may be subdivided thus:—

1. Breaking and storage.
2. Milling.
3. Roasting.
4. Grinding and classification.
5. Agitation and cyaniding.
6. Filter pressing.
7. Disposal of residues.
8. Precipitation and clean up.
9. Re-treatment.

Breaking and Storage.—The ore is tipped upon a grizzly, the fines pass through and the oversize goes into a No. 5 Gates' breaker, capacity 500 tons per diem. The products of breaker and grizzly meet at the foot of the breaker and fall on a Robins conveying belt, which distributes the ore evenly over a storage bin of 350 tons capacity.

Milling.—The ore is now fed from the bottom of the coarse ore bin into a row of three ball mills, size No. 5, by means of automatic bump feeders. These mills reduce from 38 to 44 tons of ore per diem and grind it until 50 per cent. will pass through a 150 mesh screen. The crushed ore falls from the mills through a chute into a spiral conveyor, which passes it to the fine ore elevator. It is then stored in a bin holding about 60 tons.

Roasting.—The fine ore is fed from the bin to a double push conveyor by means of another screw, and this in turn pushes it along the line of six Merton roasting furnaces, which have a capacity of 20 tons per diem of ore running 4.5 per cent. of sulphur. The ore after roasting is conveyed by another push conveyor to a Krupp elevator of the chain and bucket pattern, and this elevates it to the height required for all future handling.

Grinding and Classification.—The hot ore falls from the mouth of the elevator into a vortex mixer, where it meets a stream of weak cyanide solution, and is here converted into a pulp consisting of one ton of ore to five tons of solution, and this gravitates to a row of eight Forwood-Dunn grinding pans. Here the grinding is carried on until, approximately, 93 per cent. of the total product will pass a 150 mesh screen. Mercury is added to the pans and a fourth of the gold contents of the ore is collected in the form of a crude amalgam. This passes on to the clean-up room for further treatment in the amalgamating barrel. From here the clean amalgam is pressed into balls and retorted. The bullion averages £4 per ounce.

The overflow from pans runs to the "settlers," where four parts of the solution is separated and again returned to mixer for treatment of a further quantity of ore. The thick pulp is drawn through taps at the bottom and passes on to the agitation plant.

Agitation and Cyaniding.—Here are six vats, each 22 feet diameter and 6 feet deep. One is used solely for re-treatment purposes and the other five for ordinary slime. The pulp is kept agitated here for 16 to 18 hours with cyanide solution of strength 0.06 to 0.08 per cent. cyanide.

Filter Pressing.—The pulp is charged into three 5 ton presses by a three-throw plunger pump, and the washing is done by another pump of the same type. The gold solution after being separated from the ore runs into a large storage tank.

Precipitation and Clean-up.—The gold solution is elevated by centrifugal pumps to another tank at a height of 30 feet, for the purpose of having a steady pressure on the clarifying press. This press removes all fine mud from the solution and it then goes to the extractor boxes. After gravitating through the boxes it is deprived of 47 per cent. of the gold contents and is again ready for use in the plant as weak solution.

For clean-up purposes there are the following:—

One lead lined aciding tank.
One gold slimes filter press.
Two muffle roasting furnaces.
One tilting retort furnace.
One refining mud furnace.
These only come into use once a month.

Disposal of Residues.—This is now done by men trucking from chutes directly under the presses. Owing to the growth of the dump it has been found necessary to instal a belt conveyor, which will elevate to 60 feet. It is set at an angle of 60 degrees.

UNDERGROUND HAULAGE.

(A paper read before the British Society of Mining Students.)

By John Bell.

At collieries having large royalties and seams, worked to a rather inconvenient distance from the shaft for horse haulage, one of the important problems the colliery manager has to face is the introduction of the most suitable system of mechanical haulage to convey a quantity of, say, 1,000 tons of coal to the shaft in eight hours.

This output will not be attained until the seam has been fairly won and developed. A period of 18 months or so is necessary to reach this stage of development, but the adoption of a particular system of mechanical haulage has to be carefully considered and preparations made for it from the very commencement of the winning of the seams and opening out of the intended main roadways.

One thousand tons a day is a fairly good output of coals from one shaft bottom, or from one seam in an eight hour shift, and the following consideration of the subject of haulage is based upon such output.

Very rarely the coal-drawing shaft is situated near the centre of the royalty, and as the area to be worked comprises in many instances 1,000 acres or more, the whole being contained in an irregular shaped plot, the haulage roads sometimes have a distance of from 1 1-2 to 2 or more miles to go before reaching the limit of the undertaking.

To those familiar with extensive underground workings it is well known that the main roads are sometimes driven with many turnings, either to prevent trespassing on other colliery leases, or to avoid the payment of wayleave rents, or to pass well aside of old workings, or the undermining valuable property, injury caused to which may be very costly, etc. Therefore, the distance and direction of the intended main roads, approximate number of branch roads, and necessary curves have to be designed and their intended courses marked upon the working plan after mature consideration of all the influencing circumstances.

Again, it often happens that it is decided upon to win other seams by drifts from the principal one. Also it is a very fortunate colliery that has few or no faults of great or little magnitude to contend with, and consequently these must also be taken into account when deciding upon the system of hauling to adopt.

One important item to consider in which experience is gained as the early workings proceed, is the nature of the roof and sides of the main roads, because upon this more than upon anything else is the final decision made; as a certain method of haulage, much favored by some mining engineers, can only be worked under a very good roof.

Mechanical haulage in Great Britain resolves itself into two systems, *Main and Tail Rope,* and *Endless Rope.*

Endless chain haulage is almost identical with endless rope, but rarely used underground, though perhaps oftener on the surface for short distances. Electric and compressed air motors can only be successfully used in high seams, and therefore are not adapted for British mines, which have haulage roads often not more than 5 feet high. These motors are generally used in American and Canadian mines, but a description of them does not come within the scope of this paper, as there is less likelihood than ever of their being installed in this country.

It has for a long time been a debatable question with mining engineers as to which is the best system of haulage—main and tail or endless rope. Some mining districts in past years have almost exclusively adopted one of these methods, as the North of England with main and tail; other districts, such as the Midland Counties and Lancashire, using endless rope.

Each method can only be a success under certain local circumstances. But naturally we all prefer that system we know best, and from long use are thoroughly familiar with, giving it preference for the intended work we have in view, and which may be afterwards successfully accomplished; although installed by others accustomed to it, a different system of haulage may be even more economical and successful because best suited for the seam. The best results in the after working cannot be obtained by a system carried into effect by those totally inexperienced in its design and installation.

The two systems of haulage we are considering are entirely different from each other. The Main and Tail does not admit of much variation from its general principles, except that sometimes for comparatively short distances or sections along the engine plane from the shaft in which dip gradients inward prevail the tail rope can be dispensed with. But the other method—the endless rope—can be arranged in many different ways, and consequently there is greater scope for ingenuity and invention for those who have to lay it out.

Main and Tail Rope System.

We will first deal with the above system. The Main and Tail rope can be adopted in *all* mines, but the conditions most favorable for the successful working of it are: (1) Straight long engine planes with the branch roads leading off it at some distance from the shaft, thus allowing the sets to attain a high speed. (2) Engine planes having curves of large radius; the engine plane can be formed with any number of curves bearing to the right hand or to the left along its course without extra risk of derailment of tubs, whereas curves are not easily negotiated in the endless rope system. (3) Narrow roadways requiring only sufficient width for a travelling road at one side of a single line of rails. These narrow roadways can be quickly pushed forward with the aid of heading machines if speed of driving is required, and a travelling passage in addition to the necessary refuge holes tends to the safety of the workmen on their way to and from the workings.

Another question rarely considered when comparing the two systems is the time lost by men and boys travelling underground to and from their work where they have long distances to go, sometimes two miles or more before reaching the end haulage station or coal face. Sometimes this travelling—especially if the roads are low—takes up at least an hour each way, and by the time the men reach the face they are much exhausted, consequently valuable time and money producing energy is wasted to the detriment of all concerned. In the system we are considering this can to a great extent be avoided, for the men and boys can be quickly taken inbye fresh to their work by riding in the set and out again when the shift ends, thus giving them the maximum time

for a day's work at the face. Under the endless rope system of slow travelling tubs this cannot be done.

Disadvantages of Main and Tail Rope.—It naturally follows that where sets of tubs, each made up of from 30 to 60 or more in number, travelling at a high speed for long distances to and from the shaft at frequent intervals, accidents will now and again happen, either from derailed tubs, breakage of couplings, ropes, or wheels, loose rollers, falls of stone, switches turned the wrong way, and from other causes, resulting in a stoppage of work for a period of half an hour or longer. Extra length of shaftings and also of sidings at the inner end of haulage stations must be made to hold a surplus number of tubs in case of accidents, to ensure regularity of work without delays.

Also the intermittent nature of the running in bringing the loaded tubs to the shaft is a disadvantage. More steam for the time being is required, and a large engine, whilst the wear and tear of material is rather high.

Branch Roads.—The working of branch roads for this system is much simpler than it is for the other method. No connecting driving wheel is required at the junction, only a return wheel at the branch engine plane terminus for working the rope. The connection of the ropes to those working the main engine plane being simply and quickly done by the offtake boy stationed at the junction. In order to facilitate the haulage where it is necessary to win large tracts to the right and left of the main engine plane, it is best to turn the branch roads from the main haulage road nearly opposite each other, but in practice this may not always be possible.

Every one of these roads is either driven from the main way by means of a carefully made curve, or the connecting curve is made later before the working of the branch begins. The haulage rope for it is laid from the junction, inward, over a return wheel at the far end and back again. Each end of this rope is provided with a split link. These links are exactly opposite two similar links on the main and tail ropes when the journey of full tubs is at the shaft, so that all that is required is to disconnect the main and tail ropes at these links, and join on the branch ones, using a small hand winch to draw the main and tail joints to a position opposite each other if they are not quite up to their mark, change the switches and rap the set in to the landing.

These junctions are generally called offtakes. A boy is stationed at each offtake, whose duty it is to divert the sets into the branch road, for which purpose he telephones to the shaft, and changes the switches and ropes.

Shaft Sidings.—Main roads and shaft sidings should be turned away if possible at right angles 10 or 12 yards distant from the shaft.

Owing to the large number of tubs travelling by this system it is necessary to make long shaft sidings and also inbye landings to store them. Suppose sets of 60 tubs are run, then the sidings must be long enough to contain 60 + 20 spare tubs which sometimes remain undrawn in front, and also an additional length of 30 yards at the inbye end to allow of clearance or for a rising gradient. Tubs which contain 10 cwt. are 5 feet 2 inches long, including coupling chain. ∴ 5 feet 2 inches × (60 + 20) = 413 1-3 feet, say 138 yards + 30 = 168 yards, thus making the length of shaft sidings 168 yards.

If coal is drawn to both sides of the shaft then the same arrangements must be made also at the other side.

The sidings are divided lengthways into two parts, each sloping in opposite directions. The higher portion known as the "kip" is for the full tubs, and is made to fall towards the shaft at a gradient of 1 in 72, so that a loaded tub may run by gravity to the shaft. The road for empty tubs is formed with a falling gradient *from* the shaft for about four-fifths of the length of the siding, rapidly rising at the far end. This depression is called the "dish," and is about 4 yards wide.

Inbye Landings.—These landings do not take much making and need only be wide enough for a double road, with a travelling way for men and ponies between them and sufficient clearance from the timbers at the side; 3 1-2 yards is generally wide enough. They must also be long enough to contain a full set of 60 tubs, and additional length to accommodate other 20. Consequently the total length will be about 138 yards.

Spring switches instead of the old lever switches are laid at the entrances to landings, and at the inbye end of shaft sidings.

Intermediate Collecting Stations alongside Main Roads—Sometimes it is necessary to open out a small district on one or on both sides of a main haulage road. In either case one landing laid alongside the engine plane will suffice. Such landing can be formed without much trouble if the roof is good by taking coal from both sides of the main way, thereby increasing the width sufficiently to allow an extra road to be laid along each side of the haulage road for a length of 138 yards. There must be sufficient space between these roads to allow tubs to travel freely at a high speed along the main haulage road. A width of 4 1-2 yards would be required for this purpose under the given conditions. Movable clams[1] crossing the main road allow the tubs to be taken from one side to the other as required, ordinary switches being used at the top end to direct the tubs in or out. (See Fig. 1.)

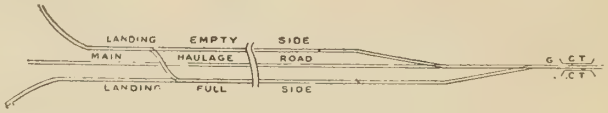

Fig. 1.

Arrangement for Landing on a Through Main Haulage Check Table.

G—Greaser. C T—Check Table.

floor level of the curve a series of revolving horizontal

Laying out and working Curves.—Curves on haulage roads are a necessary feature in mines, and require careful laying out. The curved debouchure of a branch road is generally made a little wider than its continuance. A long row of strong props is securely fixed between roof and floor, from 3 to 4 feet apart, all round the curve on the inside of the inner rail; then strong horizontal deals are nailed to them, one deal length extending from prop to prop at a height from the floor slightly less than that of the tub. On these deals a thin iron or steel rubbing plate 6 inches broad is nailed, and placed in such a position that the tubs passing to and fro rub against the metal all the way round the curve. At

[1]Clams are long bridge rails, more or less curved, as required, moving on pivots at one end and connected to the rails on a branch road. These clams then go over the top of the principal haulage road rails, and their free ends are widened out and sharpened. These ends can be moved into position over the top of the main road row of rails at any point required, thus allowing tubs to be diverted without any check into the first branch heading.

drums, 4 feet in diameter and 9 inches in height, are placed for guiding the rope, so that the latter rubs against and causes the drums to revolve, thus reducing friction as it moves in either direction. Along the whole length of the curve between the props and coal side vertical sheaves are fixed at intervals of 8 yards, for guiding and reducing the friction of the tail rope. (See Fig. 2.)

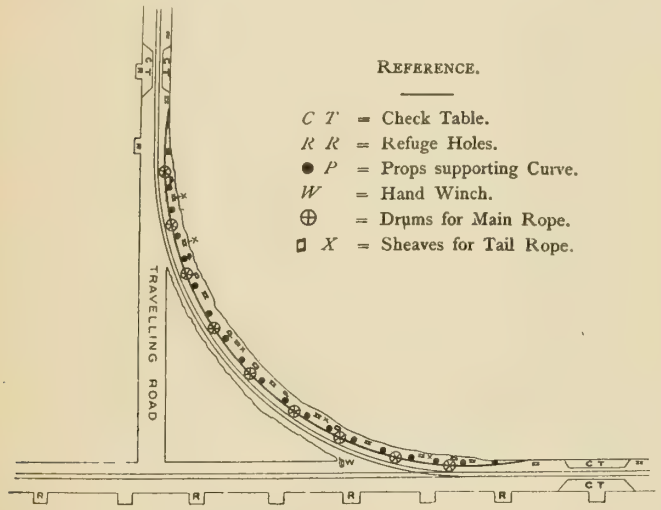

Fig. 2.
Curve for Main and Tail Rope System.

Return Wheels. — Unlike the erection of return wheels in endless rope haulage, that of the Main and Tail system can be quickly and effectively made secure. In order to do this it is necessary to fix two strong balks at a sufficient distance apart for the insertion of the wheel between the balks being well let into the roof and floor to a depth of 2 feet above and below, so as to give the balks a slight inclination. The balks are spaced apart by having a distance-piece bolted to them at top and bottom, and at their centres are attached bearings to take a large grooved pulley 5 feet in diameter between them. This wheel must be securely fenced in. Sometimes this pulley wheel is fixed in an horizontal position below the floor of the road, but the writer is of opinion that in order to resist the tremendous pull exerted upon this pulley when the sets are running, heavily loaded at a high speed up a steep gradient, the vertical position is much stronger than the horizontal. It can also be better examined and oiled than when laid under the floor of the roadway and boarded over. Again, the vertical position offers better facilities for connecting another rope pulley on to it, if the occasion to use a rope-driven pump for forcing water out by, should arise at any time. If the use of such pump were adopted it could be worked when the haulage rope was running.

Haulage from Workings Proceeding in the Direction of Dip.—Sometimes small districts or flats to the dip have to be worked, and the coal therefrom brought to the end of the main haulage road. In such a case an economical method of conveying the dip coal may be obtained by forming a two-way siding capable of holding from 15 to 30 tubs depending upon the gradient, distance, and size of district at a suitable place in the workings, and connecting this siding with that at the end of the main haulage road by an engine plane for direct haulage, which could be worked by means of an additional rope from the landing inside siding. The sets of tubs can be made ready, the one at the end of the main haulage road for transference to the shaft, the other at the inside siding for transference to the main haulage road. The two ends of the rope then lying on the floor of the direct haulage road are attached, one to the hind end of the set of tubs going to the shaft, the other to the front end of the set at the inside siding. This rope then connects the two loads, it having a slip bolt and pin, or a dog as it is called, at the outby end for easily disconnecting it from the main set.

The engine in hauling out the main set at the same time also pulls out the smaller one to the top end of the landing, where the inside rope-end is attached. It is, however, necessary to slow down or stop the shaft set while the disconnection is being made, owing to the great length of the main haulage road compared with that of the direct. A single horse may be employed to pull in the required number of tubs securely dragged or scotched to the siding, the rope being attached and trailed in behind the set, so that in this way much horse labor is saved. Or, if the gradient is suitable for the tubs to be run in by gravitation, the use of a horse will not be required at all. In that case the gradient must be uniform, and such as to ensure the tubs spragged or unspragged descending the road gently.

Check Tables.—In both systems of haulage it is necessary to have check tables laid at distances of about 200 yards apart on the main road, and always at the entrances to landings or sidings, and at both ends of curves. These are made of wood 6 feet in length measured over the rail, and 4 inches in height, and are firmly fixed to the floor and sides, so that when any derailed tubs either full or empty reach the check tables they are directed on to the rails again.

Automatic Tub Greasers.—These are fixed at the entrances to the landings, and also at both ends of the shaft sidings, for full and empty tubs. These to a considerable extent reduce the friction of the tub axles, and are of great benefit to the putters and horses.

Friction Rollers.—Rollers of iron and wood are fixed at suitable distances apart to keep the ropes off the roads and reduce friction. They are generally placed from 8 to 10 yards apart on the main way. Iron or steel rollers are best on heavy gradients as they last much longer, wooden ones being better on level roads. They are generally arranged thus:—Every three succeeding rollers throughout the engine plane consist of one iron one followed by two wooden ones. They should be fixed in suitable boxes, which are firmly placed in the holes sunk in the floor, instead of as is frequently done, nailed to stretcher-pieces reaching from sleeper to sleeper, and consequently easily torn up by derailed tubs, afterwards often to cause the derailment of others. Rollers are 5 inches in diameter and 9 inches in length.

Grooved sheaves from 12 to 15 inches in diameter and 3 inches in width are used for the tail rope, and are placed from 10 to 12 yards apart.

Refuge Holes.—For this system of haulage, where there is very little spare room between the tubs and the coal side, the Coal Mines Regulation Act requires refuge holes to be at no greater distance apart throughout the length of the engine plane than 10 yards. These refuge holes should all be on the *same* side of the road, and opposite the side the rail rope travels along. They must be kept perfectly clear from deposits of rubbish, timber, and in-filling of every description, and should be frequently whitewashed, so that they can be readily seen in cases of emergency.

Automatic Detaching Hook and Safety Bar Attached to the "Sets."—To the fore end of the leading tub of

every full set an automatic detaching hook is fixed. This is made of wrought iron. The low portion has a link which fits in to the coupling hook of the tub; another half link on a swivel can be turned up and made fast by a collar. To this the main rope is attached. On the top is a crook which fits on the tub end. A bell crank lever at this point has a chain connected to the collar. As the first tub of an outgoing set approaches to within 40 yards of the shaft the lever strikes a horizontal bar and is forced over; this action lifts the collar and detaches the rope, which falls over the "kip" side, allowing the tubs to run by gravity to the shaft. (*See Fig. 3.*)

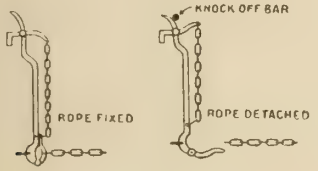

Fig. 3.

Automatic Detacher for Main Rope.

Where full tubs have to be hauled up heavy gradients a strong trigger is attached to the hind end of the last tub. This is a bar of iron 1 1-2 inch in diameter and 3 feet in length, suitably bent. One end is fixed to the tub at a point two-thirds the height of the tub from the floor, the other having two fangs rests on the tail rope. If the couplings or the main rope breaks the fangs slip off the rope as the tubs run back and the pressure forces the fangs into the floor or into a sleeper and throws the last tub off the rails; this stops the other tubs from running wild down the declivity and prevents much damage from being done.

Run-Rider.—A boy 17 or 18 years of age is frequently employed as rider on a set. His duty is to see that the set is immediately stopped in case of accident from derailed tubs, broken rope, etc. He also attaches the rope to the leading end of every set and sees that all are ready for its journey in or outbye. The duties of this attendant are often dangerous and his services should be dispensed with wherever possible, especially on heavy gradients.

Signalling.—In all methods of haulage, electric signals and telephones are placed for use between the shaft and the engine-house at one end to all inbye landings.

Automatic Chocks and Catches.—Over portions of an undulating engine plane, the rising gradients for full or empty tubs are provided with some means for preventing the tubs from running back. Spring chocks and automatic catches are used for this purpose. The former are best for light gradients, the latter for great inclinations. Spring chocks are made for a piece of wood, 8 feet in length, 9 inches in width, and 3 inches in thickness. Upon this plank the spring proper is fixed. It is made of elm, 4 inches deep, tapering from 3 inches wide at that extremity which is fastened to the bottom piece by two bolts to 1 inch wide at a point near the other end where it widens out again. This free end is in contact with the side of a wooden chock, plated with iron and pivoted at one end to the plank below by means of a bolt. A short chain prevents this chock from coming out too far, and thus ensures continual contact between the spring and the chock, but the action of the spring when not forced back always presses against the chock sufficiently to cause its unpivoted end to project slightly beyond and over one rail of the tub road. The tubs in passing the chock force it back, but as each wheel clears the chock, it springs out again and crosses one rail, so as to form an effectual stop to the return of tubs. These spring chocks are always fixed between the rail and coalside. (*See Fig. 4.*)

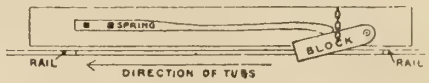

Fig. 4.

Automatic Chock.

Automatic catches, shown in Fig. 5, are fixed midway between the rails. They are simply made, and each consist of an iron bar fixed slantingly to work on a pivot attached to a thick sleeper. The heaviest and longest part of the bar works in a cavity in the floor; the upper portion projects above the tub axles. As each axle passes over it, the bar is depressed, but as soon as the tub has passed byond it, the catch rises again owing to the superior weight of the portion below the pivot, and thus

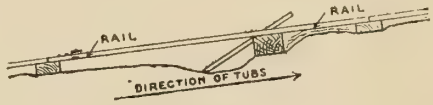

Fig. 5.

Automatic Catch.

prevents the tubs from returning. Ordinary stopblocks, plated with iron, the longer piece crossing one or both rails, are also used for preventing tubs from running back.

Automatic Doors on Haulage Roads.—It is sometimes imperative to have doors on main haulage roads for ventilation purposes. Needless to say, only the strongest necessity excuses their use on such roads, and where heavy canvas doors are not satisfactory, then wooden ones should be erected. There must always be two doors fixed distant from each other rather more than the length of a full set of tubs, so that the space between allows of the whole set passing through one door before the leading tub reaches the other.

Formerly trapper boys were employed to open and shut these doors when required, as the sets were approaching and were not to be stopped; but the work was always a source of danger to the lads, and accidents often happened either through carelessness or ignorance.

Consequently, self-closing doors were invented which could be opened automatically from either side by the approaching sets of tubs. The following description will be understood by reference to Figs. 6 and 7, which are a plan and elevation respectively of them.

These doors are made in halves on overhead travelling pulleys moving on rails in the upper frame; the leading tub of an in-going or out-going set forces them asunder before quite reaching them. On each side of each half of the door an iron bar 12 feet long is fixed horizontally at a height above the floor equal to half the height of the tub and secured at one extremity to the door by a hinge so arranged that the bars act from either side of the doors as required by the approaching set. The ends of the bars farthest from the doors work in eyebolts

fixed on vertical posts having plenty of room to slide through them.

The rails on which the pulleys run are inclined towards the centre of the road, so that the doors are forced upwards and at the same time sideways by the

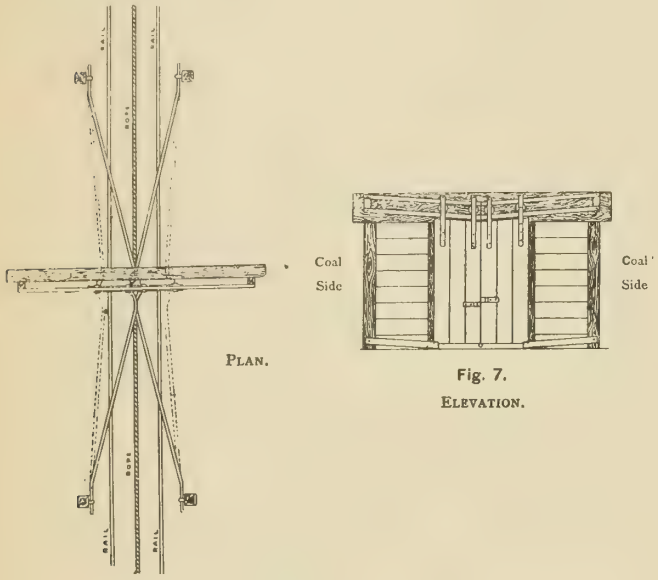

Fig. 7.

6.

AUTOMATIC DOORS

passing set, which on coming into contact with the bars pushes their inner ends apart carrying the doors with them, which close by gravity after the last tub is though. The main rope travels through a small opening left at the bottom of the two halves. The tail rope runs through a small hole in the casing between the doors and the side of the way.

Method of Finding Size of Engine Required for Main and Tail Rope Haulage.—Suppose 500 tons a day have to be hauled up an incline rising 1 in 6, 1,200 yards long, in five hours, steam pressure 60 pounds at the engine, coefficient of friction 1-20th.

500 tons in 5 hours = 100 tons an hour. Assume speed of sets 10 miles an hour equals 880 feet per minute. Time for set to run 1,200 yards. $1,200 \times 3 \div 880 = 4.09$, say 4 minutes.

Empties take the same length of time. ∴ a set is run in 8 minutes. 8 minutes a set = $60 \div 8 = 7$ 1-2 sets per hour. .. $100 \div 7$ 1-2 = 13 1-2 tons a set.

Assume 10 hundredweight tubs, each have a tare of 4 1-2 hundredweight. 27 tubs are required to carry 13 1-2 tons. Total weight of coal and tubs = 27×4 1-2 $\div 20 = 6.07$. .. $13.33 \times 6.07 = 19.40$ tons.

On a gradient of 1 in 6 these full tubs exert a pull of 19.4—6 = 3.23 tons, neglecting friction. To find size of rope, a factor of safety being 6. ∴ rope must have a breaking strain of $3.23 \times 6 = 19.4$, say 20 tons. A suitable rope for this will be 5-8 inch diameter, and weigh 2 1-4 pounds per yard. Total against engine, including gradient and friction, will be—

Full tubs, 19.4 tons ÷ 6 = 7,242.66 pounds.
Rope, 1,200 × 2 1-4 ÷ 6 = 450 pounds.
Full tubs, 19.4 tons ÷ 30 = 1,448.5 pounds.
Rope, 1,200 × 2 1-4 ÷ 30 = 90 pounds.
Total number of pounds 9, 231.16.

To this total we add 50 per cent. for general resistances. ∴ 9,231.16 × 50 per cent. = 13,486.74 pounds. Rope travels 880 feet per minute. ∴ 13,846.74 × 880 = 12, 185,131.2 foot pounds of work the engines must do.

Piston speed to be 250 feet per minute. ∴ 12,185,131.2 ÷ 250 = 48,740.5 pounds of work done at one revolution.

Steam pressure, 60 pounds. ∴ 48,740.5 ÷ 60 = 812.34 square inches is the area of *both* cylinders. ∴ area of each is 406.17 square inches.

Diameter of each cylinder = 22.8 inches, and stroke 45 inches.

Number of revolutions, $250 \times 12 \div 90 = 33$ 1-3 per minute.

Size of drum, 880 ÷ 33 1-3 ÷22 ÷ 7 = 8.4 feet diameter.

.. dimensions of engine.

Double cylinders, 22.8 inches diameter, 45 inch stroke, 33 1-3 revolutions per minute. Drums, 8.4 feet diameter.

Endless Rope Haulage.

Endless rope has been called the ideal system of underground haulage by those persons who have become experienced in its use, more especially if the conditions have been favorable for its adoption.

It certainly has in some instances advantages over the main and tail system, but, unlike the later, it cannot be adopted in every seam.

Disadvantages of its use.—It requires a continuous double line of way, one side solely for full tubs coming outbye, the other for empties going in to the workings, together with extra width for a travelling way. It cannot, therefore, be used in seams having weak roofs, necessitating a narrow engine plane. Again, despite what may be said to the contrary, under certain methods of fixing the tubs to the haulage rope, curves are not so easily worked as in the main and tail system. More tubs are required, and more boys must be employed. The rope must be kept tight and adjusted by means of tension screws or bogeys, these being generally, but not necessarily, placed at the inbye end of the terminus. The working of branch roads sometimes is a source of trouble unless the connecting pulleys and switches are carefully laid out. Owing to its slow speed workmen cannot be quickly conveyed in or outbye to or from their work by means of the tubs; so that their working time—a source of profit to both themselves and the owners—is reduced. This is an important factor where working places in large collieries are 1 1-2 to 2 1-2 miles from the shaft. The clips frequently are a source of trouble, especially on heavy gradients, for they are liable under the heavy stress prevailing to become detached, causing the tubs to run a-main, or leave the rails. A constant clipping of the rope injures it by compression, making its life shorter than otherwise it would be, whilst broken strands are of frequent occurrence, causing stoppage of work and frequent repairs.

(To be continued.)

D. A. Thompson, M.P., has arrived at Ottawa from Dawson to attend the Parliamentary session. Referring to conditions in the Yukon, Dr. Thompson expresses a very optimistic view of the future of the country and anticipates a large annual production of gold, at least equal to the best past records in this respect, at no very distant time. One corporation alone last year employed 1,500 men in conection with equipment operations, while next year a still larger force will be engaged. Dr. Thompson, moreover, does not agree with the generally expressed opinion that the day of the individual miner in the Yukon is over; for, he maintains, there are still rich fields, which may be developed by individual effort.

IRON ORES, PIG IRON AND STEEL.

By Edwin C. Eckel.

(Abstract from advance chapter from "Mineral Resources of the United States," for 1906.)

Introduction.

The year 1906 witnessed a steady growth in production in all branches of the iron industry, from ore to finished products, previous records being broken in production of ore, pig iron and steel. Coincident with increase in production came increase in prices, which rose steadily from the begining to the end of the year, with the exception of a slight depression in June. These movements in output and price must be regarded as continuations of the growth shown during 1905, and their relations to the past history of the iron industry, can be noted on comparison of the records of the industry for a number of years preceding.

The chief factors in keeping prices down to a reasonable level have been, curiously enough, the great iron and steel producing corporations. Their attitude in this matter is not, of course, dictated by altruistic motives, but it affords a refreshing contrast to the method of procedure which a few years ago would have been considered to be the immediate consequence of the consolidation of interests in any industry. Realizing that steady sales at reasonably high profits are in the end better than a runaway market with its consequent great fluctuations in both prices and sales, all efforts have been made to steady the iron market so far as is possible, and until within a very recent period this policy was markedly successful. Toward the very close of the year, however, prices in several lines rose more sharply than is generally considered advisable, and it is doubtful as to how far control would be possible in 1907 in case generally prosperous business conditions should maintain a high demand for iron and steel products. It is known, moreover, that heavy increases in production will be possible during the latter half of 1907 and in 1908, and the probabilities are therefore in favor of lower rather than of higher prices in the near future.

Production.

The iron-ore production of the United States in 1906 amounted to 47,749,728 long tons, valued at $100,597,-106. As compared with 1905, the most productive previous year, this was an increase of 12.28 per cent. in tonnage and of 33.83 per cent. in value.

Varieties of Iron Ore Produced.

The iron minerals which are used as ores of that metal fall, when considered from the chemical point of view, into two classes—oxides and carbonates. The latter are relatively very unimportant in the United States, furnishing less than one twenty-fifth of 1 per cent. of the total output. The important group of oxides, moreover, is separable on both commercial and scientific grounds into three sub-groups, the ores of which differ in composition, grade, and geologic associations.

The final grouping used in this report, therefore, is as follows, the varieties being named in order of their present productive importance:

1. *Red hematite*: Including all the anhydrous sesquioxides known locally as red hematite, specular ore, fossil ore, oolitic ore, etc.

2. *Brown hematite*: Including limonite, gothite, and other hydrous sesquioxides known locally as brown iron ores, bog ores, etc.

3. *Magnetite*: Including the magnetic oxides.

4. *Carbonate*: Including the iron carbonates of various types.

Value of Iron Ore Per Ton.

The following table presents data on the value per ton of the different varieties of iron ore in the various producing States. The values given are intended to represent value at the mouth of the mine, and are taken directly from the replies of the producers. It is probably unnecessary to caution the reader that any such table must be accepted as merely a fair approximation to the truth. The element of inaccuracy arises from conditions in the iron-ore business and can not be readily overcome. By far the bulk of the iron ore produced in the United States is mined directly by pig-iron producers for use in their own furnaces, and the valuation which they place on such ore is therefore entirely a matter of accounting. In some cases the reports made to the Survey evidently include merely actual mining costs; in others they contain an allowance for sinking funds; and in still other instances the values given are obviously merely convenient prices to use in charging costs against the blast furnaces.

It is noted, however, that the errors are almost entirely in one direction—that of undervaluing the ore rather than of overvaluing it. If all the American iron ore were to bought by iron furnaces in open market from an entirely distinct set of iron miners, the average prices paid would probably be considerably in excess of those now reported.

Average value per long tone of iron ore in the United States in 1906, by States and varieties.

Stocks of Ore at Mines.

The stock of ore on hand at mines on December 31, 1906, amounted to 3,281,789 long tons, a decrease of 13.92 per cent. from the stock held on December 31, 1905—3,812,281 long tons, which in turn was a decrease of 18.31 per cent. from the quantity in stock on December 31, 1904. The stock in 1906 represented about 6.8 per cent. of the total output of the year.

Iron Ore Reserves of the United States.

About two years ago, in response to a request from the Swedish Parliament, an eminent Swedish geologist prepared a report on the iron ore reserves of the world. The report itself attracted little notice in the United States, even among those directly interested in the iron industry. Early in 1906, however, a summary of the report was forwarded by the American consul at Paris, and the wide circulation given to consular reports in America resulted in drawing considerable attention to the matter in both the daily and the technical press.

The character of the report in the form in which it reached the American public is fairly indicated by the following extracts:

It will surprise a great many to learn that we are likely to run short in iron inside of a single century, if we keep up the present rate of consumption. As a matter of fact we are more likely to increase the consumption than we are to reduce it. The world has only 10,000,000,000 tons of iron ore available. Of these Germany has twice as many tons as the United States. Russia and France each have 400,000,000 tons more than this country. * * * Assuming therefore as true the claim of geological science that the extent of workable iron ore beds is known to within a margin of possible error not exceeding 5 per cent., the Swedish report, which is based upon the most authoritive information, has naturally attracted world-wide attention. * * * The present output of ore and the amount of ore actually consumed by each is as follows, in tons:

Country.	Workable deposits.	Annual output.	Annual consumption.
United States	1,100,000,000	35,000,000	35,000,000
Great Britain	1,000,000,000	14,000,000	20,000,000
Germany	2,200,000,000	21,000,000	24,000,000
Spain	500,000,000	8,000,000	1,000,000
Russia and Finland	1,500,000,000	4,000,000	6,000,000
France	1,500,000,000	6,000,000	8,000,000
Sweden	1,000,000,000	4,000,000	1,000,000
Austria-Hungary	1,200,000,000	3,000,000	4,000,000
Other countries	1,200,000,000	5,000,000	1,000,000
Total	10,000,000,000	100,000,000	100,000,000

While it is probable that the foregoing statement does not take into adequate account the undeveloped ore deposits of Utah and Alabama, its teachings are nevertheless obvious and impressive. Of the world's workable iron ore deposits, as at present known, the United States possesses only about one-ninth, and at the present rate of consumption the entire supply will be exhausted within the present century.

It must be admitted that an official statement such as this might fairly cause alarm to those unacquainted with the facts of the case and that the daily press can not be blamed for taking the matter very seriously. As a matter of fact, however, the figures given can not be accepted as reliable, and it seems desirable to present a more careful statement of the case. The original Swedish report did not do justice to the American iron ore deposits, and in the consular translation this injustice was accentuated rather than lessened.

Before taking up the subject of American iron ore reserves in general it may be well to dispose of one statement in the quotation: "Assuming therefore as true the claim of geological science that the extent of workable iron ore beds is known to within a margin of possible error not exceeding 5 per cent. * * *." This assumption appears to be entirely gratuitous. No mining geologist of any experience would make such a claim, except for very small or unusually uniform ore bodies. Elsewhere, in discussing the Clinton or red ores of Alabama, the writer has said: "The amount of Clinton ore in any area can probably be determined by a geologist within 5 or 10 per cent., and estimates of red ore reserves can therefore be made by competent men with a degree of accuracy impossible in dealing with the magnetites, hematites, or brown ores of other districts." The Clinton ore it must be remembered is an exceptionally easy ore to estimate, because it occurs in bedded form and is fairly uniform over considerable distances, both vertically and horzontially. In dealing with irregularly shaped bodies, an estimate which came within 25 per cent of the actual quantity might well be considered remarkably accurate. When, however, the estimate covers not a single area or deposit, but the total iron ore contained in a State or nation, the case is very different, for the possibility of error in such an estimate is enormous. As will be shown below, the Swedish report on iron ore reserves probably contains an error of something over 1,000 per cent. in its estimate of American ore tonnage.

The Lake Superior district, at present the leading American producer, has been explored more thoroughly than any other ore field in the United States, but estimates as to total tonnage range within rather wide limits. At present the totals commonly quoted vary from 1,500,000,000 to 2,000,000,000 tons, of which the United States Steel Corporation is commonly supposed to control over three-fourths. This supply is being drawn on to meet a constantly increasing annual demand, and it is conceded that before 1915 the district will probably be called upon to ship over 50,000,000 tons of ore a year. It is obvious that at such a rate the Lake Superior ores can hardly be expected to last beyond the year 1950, and it is equally obvious that long before that date the value of good workable deposits of iron ore, both there and elsewhere in the United States, will have increased immensely. During the past year ore lands in the Lake district have been sold at a valuation of $1 per ton of ore in the ground, though the average valuation is still, of course, considerably below that price.

In the Rocky Mountain and Pacific States a few large iron ore deposits are known to exist, and many others are reported, but any attempt at any estimate of total tonnage would be, with only our present knowledge of the subject, merely the wildest sort of guessing.

A more promising field lies in the older Eastern States. It is probable that careful exploratory work will develop magnetic iron ores in New York, New Jersey and Pennsylvania in quantities far in excess of anything usually considered possible in those States. Here also close estimates are impossible.

With regard to the southern iron ores the case is very different. Here the work which the Geological Survey has carried on during the last three years and which was planned so as to obtain data on the quantity of ore available, gives a fairly secure basis for tonnage estimates. It is safe, therefore, to submit the following figures as representing minimum values for the workable iron ore reserves above the 1,000-foot level of certain Sourthern States, with the caution that further exploratory work in the South will probably greatly increase rather than decrease these estimates:

	Red ore.	Brown ore.
Alabama, long tons	1,000,000,000	75,000,000
Georgia, olng tons	200,000,000	125,000,000
Tennessee, longs tons	600,000,000	225,000,000
Virginia, long tons	50,000,000	300,000,000
Total, long tons	1,850,000,000	725,000,000

This gives a total estimated reserve, for the red and brown ores of the four States noted, of over 2,500,000,000 tons. If to this we add the ores occuring at deeper levels in the States named, and also the red and brown ores of Maryland, West Virginia and Kentucky, and the magnetic ores of the other Southern States, it is probably fair to assume that the total southern ore reserve will amount to very nearly 10,000,000,000 tons, or five times that credited to the Lake Superior district. Much of this ore is of course unworkable at the present day, but all of it should be counted on in any estimate of total ore reserves.

In considering these figures it will be well to bear in mind that the southern red ores will average from 33 to 43 per cent. metallic iron, but that they carry so much lime as to be almost or quite self-fluxing. The brown ores, as washed, will range form 40 to 50 per cent. metallic iron. It may be further added that the estimates as to red-ore tonnage are probably much more accurate than those relative to brown ores.

To sum up the matter—in place of the 1,100,000,000 tons credited by the Swedish geologist, it is probably safe to say that the United States has from ten to twenty times that reserve of iron ore.

The present rate at which our ore is being mined is as follows:

1903, tons	35,019,308
1904, tons	27,644,330
1905, tons	42,526,133
1906, tons	47,749,728

Assuming that the demand for iron ore during the present century may range from 50,000,000 to 100,000,000 tons per year, the Lake Superior district would last for from twenty-five to fifty years more, if it supplied the entire United States. But counting on the known reserves elsewhere in the United States, the ore will last for a much longer period, though, of course, it must necessarily show a gradual but steady increase in value and in cost of mining, along with an equally steady decrease in grade. No attempt is here made to consider

a very important factor in the problem—the extent to which Cuban, Haytian, and other high-grade foreign ores may be imported in the near future.

Recent Technologic Advances.

Of processes affecting the iron industry the three which have received most attention during the last few years are probably the Gayley dry blast, electric smelting and nodulizing. The first of these is in successful operation at a number of furnaces, and is now hardly subject to discussion as a new or untried process. With the other two the case is different, and some space may profitably be devoted to a brief discussion of their probable status in the iron industry.

Electric Smelting.—There is of course nothing particularly novel in the idea of producing iron or steel in the electric furnace, though some recent experimenters appear to ignore this fact and to consider the mere electrolytic production of metal to be the mark of success. The real point is to produce metal in the electric furnaec cheaper than in the blast furnace, and concerning this possibility a great deal of discussion has taken place, often in a purely academic fashion, without much experimental basis. During the past two years, however, a number of experimental plants have been operated in various parts of America and Europe, and our knowledge of the problem is fast assuming a definite shape. Recent exhaustive discussions of the subject by Haanel, Harboard, Kershaw, and others seems to warant the following conclusions:

(1) Under the conditions which obtain in most of the settled portions of the world, neither pig iron nor ordinary structural steels can be produced in the electric furnace at a cost to compete with the blast furnace.

(2) Under exceptional conditions, where ample water power can be very cheaply developed in the immediate vicinity of the ores and when fuel is very dear, pig iron and steel can be produced profitably in the electric furnace. Harboard estimates that with electrical energy costing $10 per electrical horse-power year, and with coke at $7 per ton, the two methods are about on an equality.

(3) Electric smelting may be practicable in the case of titaniferous ores or of other ores difficult to treat in the blast furnace, if the resulting product possesses any properties which would counterbalance the increased cost.

(4) Electric smelting methods can be profitably applied to the manufacture of crucible steel or of other high-grade special steels and ferro-alloys.

It will be seen, therefore, that there is little prospect that electric smelting will have much influence on the general development of the iron and steel industries until fuel supplies become much scantier than they are at present. Considerably more practical results to the industry can be expected from the process next to be considered, though it bears on an entierly different phase of the iron manufactuer's problems.

Nodulizing.—In all furnaces, and particularly in those running on soft or fine ores, a very appreciable quantity of iron ore is carried out by the blast. This ore dust, which may amount to 5 per cent. or more of the furnace charge (equivalent to from 25 to 50 tons per day per furnace), is usually trapped before entering the stoves, so that it can be removed and stored. Its fineness, however, precludes its direct use in the furnace, and hitherto the only method of utilizing it involved the preparation of briquettes. The "nodulizing" process does away with certain difficulties inherent in any regular briquetting process and seems likely to come into general use as a means for economically handling flue dust. It is of service also in other fields, for it can handle the finer material produced during magnetic concentration, and it renders available certain sulphurous products (blue billy, sulphury ores, etc.) ,which have hitherto been treated with difficulty.

The principal novel point in connection with this process is that it employs rotary furnaces closely similar to the rotary kilns now so familiar in the Portland cement industrq. These kilns are set slightly inclined; the fine ore is fed in at the upper end and travels toward the lower end as the kiln revolves slowly. Fuel is sprayed in at the lower end, so that a high temperature is produced there. So far the process is exactly similar to that employed in cement practice. The point of difference lies in the fact that a hydrocarbon or other binder is dropped or sprayed into the ore as it is fed into the upper end of the kiln. As the materials slowly pass downward the binder mats the ore into little masses or nodules. Farther down in the kiln the greater heat causes the tar to combine with the sulphur, if the latter be present, and the two are largely volatilized. Still closer to the discharge end practically all of the binder has disappeared, but the ore nodules, now free from sulphur, still cohere, owing to incipient fusion of their particles, for the heat here approximates to 2,000 degrees F.

It will be seen that this "nodulizing" accomplishes both the consolidation and the desulphurizing of the material, and that its chief advantage, as compared with the older briquetting and roasting precesses, arises from the fact that the rotary kiln is an extremely effective labor-saving device.

STANDARDIZATION.

The Institution of Mining and Metallurgy

Salisbury House, London, E.C.,

November 4th, 1907.

Standardization.

Dear Sir,—

The circular embodying a number of questions on the recommendations of the "Weights and Measures" and "Mesh" Standardization Committees, sent to members of the Institution and other on February 11th, 1907, has elicited answers from technical societies and chambers of mines, as also from 280 engineers and metallurgists; and these answers have very strongly confirmed the conclusions of the Standardization Committeees.

As regards the general adoption of the metric system of weights and measures, opinions are so evenly divided that the Council do not feel justified in recommending uniformity of practice at the present time.

Whilst there is a very general feeling amonst engineers that the term "slimes" should be more clearly defined than at present, the suggestions received have been too divergent to justify the Council in making any recommendations on the subject at present.

I enclose copies of memoranda embodying the standards and definitions now adopted by the Council, and I am directed to express the hope that all members of the Institution, and other professional men, will adopt and use them in reports, scientific papers and other publications.

In some replies containing objections to the convenient constant of 85s. for the value of one ounce of fine

gold, the writers overlooked the fact that clause (6) in the accompanying memorandum refers only to assay results of ores, etc.; and it will be admitted that unavoidable variations in both check assays and check samples are such as to make the difference of 0.55 of a penny, per ounce of fine gold, a negligible quantity.

With a view to securing the greatest uniformity in the drawing of the wire and the manufacture of the standard screens, Messrs. N. Greening & Sons, Limited, of Warrington, England, have agreed to manufacture a certain quantity of each of the standard sizes to a width of 8 inches at one operation, and these will be supplied by them direct, by their agents abroad, or by dealers in laboratory supplies.

Note.—Sizes 5, 8, 10, 12, 16, 20, 30, 40 and 50 are now ready in 8 inch squares, and may be obtained in made-up "nests" by the end of November. The manufacture of the remaining sizes is being pressed forward with the least possible delay.

I am, dear sir, yours faithfully,

C. McDermid, Secretary.

Standardization.

Weights and Measures.

The following definitions have been adopted by the Institution:—

(1) The word "ton" shall represent a weight of 2,000 lb. avoirdupois (29,166.6 oz. troy).

[Note.—It is advisable to abandon the use of the terms hundredweights and quarters, and to express fractions of a ton in pounds or in decimals of a ton.]

(2) The term "miners' inch" shall represent a flow of 1.5 cub. ft. of water per minute; and the term "sluice head" shall represent a flow of 60 cub. ft. of water per minute.

[Note.—It is advisable to abandon the use of both terms, as being merely of local usage, in favor of definite expression of the flow of water per minute, or per second, in cub. ft. or in gallons.]

(3) The word "gallon" shall represent the Imperial gallon measure of 10 lb. of water.

(4) Temperatures shall be expressed in degrees centigrade.

(5) Returns of gold and silver shall be expressed in terms of fine gold and fine silver respectively, not as "bullion."

(6) Gold contents of ores, etc., determined by assay, shall be expressed in money values as well as in weights; and in this connection the value shall be taken (as a convenient constant) at 85 shillings, or $20.67 U. S. currency, per troy ounce of fine gold.

By order of the Council,

C. McDermid, Secretary.

Salisbury House, London, E.C., November 4th, 1907.

[Editor's Note.—The sluice head may more conveniently be taken as equal to 40 miners' inches, or one second-foot.]

Standardization.

Mesh or Wire Cloth.

The following table of "I. M. M. Standard Laboratory Screens" is intended for use in making grading tests and for the correlation of screens used in commercial or other work.

When screens other than the I. M. M. Standards are employed, the diameters of apertures should be given in any published results, so that comparisons may be made.

When screens are described simply by the number of meshes per linear inch, it will be understood that the I. M. M. Standard is referred to.

The number of sizes standardized has been reduced to a minimum, as it is desirable to abandon excessive refinements in grading tests. It is believed that the I. M. M. Standards will meet all necessary requirements of the laboratory.

In reporting grading tests it is desirable to state whether wet or dry screening has been employed.

Table.—I. M. M. Standard Laboratory Screens.

Mesh or apertures per linear inch	Diameter of Wire.		Aperture.		Screening area.
	in.	mm.	in.	mm.	Per cent.
5	0.1	2.540	0.1	2.540	25.00
8	0.063	1.600	0.062	1,574	24.60
10	0.05	1.270	0.01	0.254	25.00
12	0.0417	1.059	0.0083	0.211	24.80
16	0.0313	0.795	0.0071	0.180	24.70
20	0.025	0.635	0.0052	0.157	24.60
30	0.0167	0.424	0.0055	0.139	24.50
40	0.0125	0.317	0.005	0.127	25.00
50	0.01	0.254	0.0042	0.107	25.40
60	0.0083	0.211	0.0033	0.084	24.50
70	0.0071	0.180	0.0025	0.063	25.00
80	0.0063	0.160	0.05	1.270	25.00
90	0.0055	0.139	0.0416	1.056	24.92
100	0.005	0.127	0.0312	0.792	24.92
120	0.0041	0.104	0.025	0.635	25.00
150	0.0033	0.084	0.0166	0.421	24.80
200	0.0025	0.063	0.0125	0.317	25.00

Note.—Whilst absolute accuracy to the fourth place of decimals of an inch is impracticable in the manufacture of wire cloth, a sufficiently close approximation to the above standards is attainable.

The adoption of a screening area of 25 per cent. necessitating equality of size of wire and aperture, secures perfect interlocking and consequent permanence of aperture.

Some of the finer mesh screens can only be woven in what is known as "twilled."

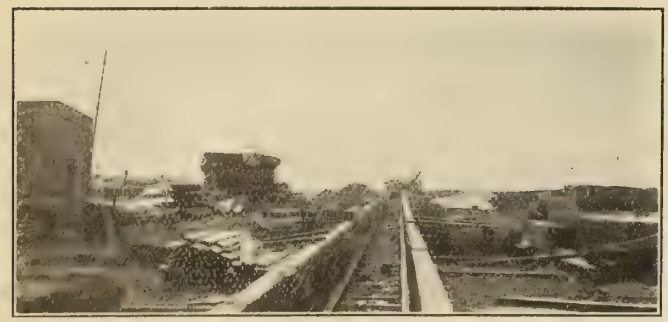
By order of the Council,

C. McDermid, Secretary.

Salisbury House, London, E.C., November 4th, 1907.

WHERE MOOSE MOUNTAIN ORE WILL BE HANDLED

Key Harbor, Ontario. — A notable step in the development of Canada will be accomplished next spring when Key Harbor, on the north shore of Key Inlet, will be a busy port. Everything is in shape here to continue, after the freeze-up, the building of the ore docks, which are to be the foundation of



Power-house Tunnel for Ore Belt and Dock Piling, showing commencement of elevation through which steamer will be loaded.

the port, and from which the product of the Moose Mountain mines will be shipped to Cleveland and other American ports. The mines, thirty miles north of Sudbury, are already piling up ore for shipment as soon as the Canadian Northern Ontario Railway is able to carry it.

The strong position of the Moose Mountain ore, owing to its high percentage of iron, is improved by the location of the mines. They are about the same distance from navigable water as the iron ranges back of Duluth, but are over five hundred miles nearer coal and smelters than Duluth will ever be.

The Government steamer "Bayfield" has about completed the survey work for the harbor and its approaches. The entrance from Georgian Bay will be quite simple, only four ranges for the guidance of vessels being necessary, the last running straight into the dock. The buoys and lights are ready to be placed in position.

The six miles grading from the main line of the Canadian Northern Ontario Railway, three miles south of French River, is almost completed, and the building at this end of a mile-long trestle will be begun immed-

Tunnel through which 42-inch belt will convey ore to docks at rate of 800 tons per hour.

iately, on which train-loads of ore will be elevated so that their contents may be dumped into pockets and transferred to a rubber belt conveyor running through a tunnel cut out of the rock, and then elevated on another belt to a trestle sixty feet above water level, where it will be held ready to be shot into the steamers lying alongside. The capacity of the dock plant will be 8,000 tons per day of ten hours. The power-house is almost finished. Coal docks must also be built, and the tran-shipment of mineral alone must make Key Harbor a port of considerable magnitude within a short time; and immediately the Canadian Northern connection with Ottawa is completed it will be the entrepot for all Canadian Northern direct traffic between tide water and the West.

At the dockside there is 24 feet of water—more than sufficient to carry the largest boats on the lakes, for the draught of the Soo Canal and the St. Clair River is only 20 feet, 6 inches. Key Harbor will markedly affect business with Port Arthur. The biggest vessels will be able to bring wheat here from Port Arthur; carry ore to Cleveland, and load coal there for Port Arthur and the West. No such economical transportation is at present possible in Canadian services on the great lakes.

The whole of the construction is in charge of Mr. R. M. Pratt, who built the elevators and coal docks at Port Arthur, and has had great experience in railroad and terminal construction for a quarter of a century.

Eight-foot cribbing alongside Ore Tunnel. Government Survey Steamer, "Bayfield," and Ice Breaker alongside natural wharf of rock.

LIGHTING CONDUCTORS AND THE STORAGE OF EXPLOSIVES.

This is a subject into which the State Electrician of Western Australia appears to have gone thoroughly. In his official report that officer recommends enclosing the magazine building in what is practically a metallic cage. This can be done by erecting three poles, one at the back and two at the front. For larger magazines four poles, one at each corner, would be better. The poles should be about four feet higher than the building, and iron barbed wire should be stretched from pole to pole across the building. The barbed wire should be connected to stray iron wires from the top of the poles to earth plates sunk in the ground. The metal work of the building should be connected to stray wires also.

The system should be modified to suit various building and dry soils.

MONAZITE AND ZIRCON.

(Advance chapter from "Mineral Resources of the United States," 1896.)

By Douglas B. Sterrett.

(*Continued from last issue.*)

The product from the mill runs between 90 and 95 per cent. monazite. A higher grade product can be obtained by careful treatment, but is not necessary. The company works the stream gravels on its property with sluice boxes and treats the concentrates obtained on one of the Wilfley tables, bringing it up to nearly 90 per cent. monazite.

Ore deposit.—At the time of vist the ore rock was being mined from a shallow open quarry over 150 yards long in a northerly direction and from 8 to 25 yards wide. The cut varied from 5 to 20 feet in depth and was irregular in shape. The rock was generally removed through the full height of the working face and the ore material was cobbed out. This was not usually difficult, as the ore rock differed in appearance from the lean. The rock was somewhat jointed and, being partly weathered, was easily removed with the aid of dynamite. The ore was hauled in tram cars, drawn by horses or mules, from the quarry to the mill at the southeast corner of the cut.

Monazite was found in all of the rock taken from the cut, though the material used for ore occurred in bands varying from a few inches to 3 or more feet in thickness, interbedded with lower grade material. In places two or more streaks were worked for ore at the same time. All rock carrying above 0.4 or 0.5 per cent. monazite was treated as ore; beds carrying a lower percentage were discarded. Mill tests made on some of the lean streaks showed only 0.03. per cent. monazite.

Geology.—The country rock is Carolina gneiss, which has been considerably altered along certain strata by pegmatization. The beds have been thrown into a series of gentle folds. The latter, as exposed in the quarry, were from 20 to 50 or more feet axis to axis. The rock as a whole is a pegmatized graphite biotite gneiss, in which certain beds have been more highly re-crystallized or pegmatized than others. The beds carrying larger percentages of monazite are those with a typical augen structure. The latter is due to porphyritic feldspar crystals, and small bodies of pegmatite, ranging from the size of a grain of wheat to that of a walnut, scattered through the gneiss. Beds where pegmatization had been small, or where nearly the whole rock has been replaced by pegmatite, do not carry as much monazite as those in an intermediate position.

Under the miscroscope sections cut from specimens from one of the ore streaks show quartz, feldspar, biotite, graphite, muscovite, monazite, limonite in films and stains, and very little zircon. Though the feldspar has been partially kaolinized and was mostly lost during the grinding of the sections, it seems to be chiefly orthoclase and microcline; but a few small fragments of albite are left in one of the sections. The greater part of the quartz is plainly secondary. It occurs in bands or streaks of grains running with the schistosity of the rock. In some places the quartz has been deposited in the fractures or between grains of other mineral, while in other places it includes fragments of such minerals as biotite and graphite. Inclusions of gas cavities and some very fine acicular mineral, probably rutile, are not uncommon in the quartz. Biotite occurs in interwoven laths and crystals roughly parallel with the banding of the rock. The pleochroism of the biotite is light yellow-brown to dark greenish-brown. The graphite occurs as plates and laths, in general lying parallel to the banding of the rock, and exhibiting various relations to the associated minerals. In some cases it is interbanded with, and even interleaved with, biotite, while in others the plates were turned across the schistosity. Monazite occurs in contact with the various minerals of the sections, though it is more often included in or surrounded by grains of quartz and biotite.

The rock has been so thoroughly re-crystallized that it is impossible to say just what the original minerals were. The quartz was evidently the last mineral to be added, and the biotite was probably the first to be formed during re-crystallization. Much of the graphite was apparently contemporaneous with the biotite; the remainder was plainly formed later. It would be difficult to give the order of formation of the muscovite, feldspar, and monazite. They are intermediate between the biotite and the quartz, or in some cases probably contemporaneous with the latter.

Western States of the United States.

The investigations carried on by the concentrating plant of the United States Geological Survey at Portland, Orog., during 1905 and 1906[4] have shown the wide occurrence of monazite in the Western States. Appreciable quantities of monazite were found in samples from gravel deposits of California, Colorado, Idaho, Indiana, Montana, Nevada, New Mexico, Oregon, South Dakota, Texas, Utah, Washington and Wyoming. In many cases it would seem that workable deposits exist, judging from the percentage of monazite recorded in the tests. In Idaho especially there have been a number of monazite-bearing deposits recorded in the following counties: Ada, Boise, Idaho, Lemhi, Lincoln, Nez Perce, Owyhee, Shoshone and Washington. In practically every case where monazite was found there was considerable zircon present. When it is remembered that many of the western deposits on which tests have been made carry gold and platinum it will be seen that they should be paying propositions if carefully handled.

Idaho.

Several years ago Mr. Waldemar Lindgren, of the Geological Survey, called attention to the occurrence of a notable mass of monazite in the granite areas of the Boise Basin.

In 1906 investigations showed that the black sand residues left in the sluice boxes of the placer mines in the Boise Basin contained much monazite, frequently 50 to 200 pounds to a ton of concentrates. Similar investigations established the fact that the old tailing dumps left by previous placer miners were also rich in this material. When the original sand, including sand down Grimes Creek, was washed out for gold there were left in the residue the heavier minerals, especially monazite, in much greater proportionate quantity than in the original sand.

Publications of the Geological Survey calling attention to these considerable quantities of monazite in the Boise Basin led to the formation of the Centerville Mine and Milling Company, at Centerville, Idaho, for the

purpose of extracting monazite from the old placer workings. Machinery was installed, and two or three tons of monazite were collected by the time severe weather set in in November, 1906. Now, in the spring of 1907, additional machinery for the magnetic separation of the monazite from the concentration of the tailings on a Wilfley table has been ordered, and much monazite is being gathered by sluicing the old placer claims preliminary to cleaning up on tables.

Foreign Sources.

Brazil.

The principal source of supply of monazite for the world's consumption has been Brazil. In the United States, however, the market for the monazite has not only practically been supplied by the home production, but during the last several years a considerable amount of high-grade sand has been exported. In return, however, there is a large importation of manufactured thorium nitrate each year.

The Brazilian deposits lie along the coasts of the States of Bahia and Espirito Santo. The monazite occurs in the sand banks and dunes on the beaches, where it has undergone partial concentration by the action of the tides and waves. Gravel deposits of commercial value have also been reported along the Rivê Parahyba, where a plant has been erected to test their value. The exploitation of the Brazilian beach deposits was first undertaken by John Gordon, an American. In the early days of mining Gordon shipped monazite sand as ballast at a cost of less than $15 per ton, to Hamburg, Germany, where he realized large profits on it, since the lowest price at that time for sand carrying 5 per cent. of thoria was $95 to $120 per ton. Later he was forced to enter an agreement with the German combination of thorium manufacturers without being able to establish the intended monopoly of the export of Brazilian monazite. In 1903 the Barzilian legislative assembly decided that the deposits of monazite sand along the coast belonged to the Federal Government and forbade their exploitation. Later bids were let for the privilege of working these sands, and the rights were finally secured by A. C. De Freytas Company, of Hamburg. This company guaranteed a royalty of 50 per cent. of the sales made and an annual production of 1,700 tons. The De Freytas Company soon went into partnership with Gordon, and together the made an agreement to sell their whole product to the German thorium syndicate. From the latter they were to receive, in addition to the selling price, a share of the profits from the sale of thorium nitrate. In this way the thorium syndicate has held a partial monopoly over the production of monazite from Brazil.

When it was found that other manufacturers of thorium products were able to obtain supplies elsewhere and that the whole output of Brazil could not be controlled, the German thorium syndicate decided to kill out all competition. Accordingly, in January, 1906, the price of thorium nitrate was reduced to nearly half of that prevailing at the time. The quantity of nitrate sold to each consumer was limited to his demands and was so placed as to conflict with the attempted sales of companies not in the thorium syndicate. In this way the aquisitions by brokers of large quantities of low-priced thorium nitrate for speculative purposes was avoided. This cut in the price of nitrate has been injurious or fatal to several smaller manufacturers of thorium products who had supplies of high-priced material in stock, though it has not seriously affected larger well-established firms mining their own monazite. The effect on the production of monazite in the United States has been very small, and it is doubtful whether the total output was in reality less than in 1905. The production all came from North Carolina and South Carolina, and represents the output of five companies, with a few independent producers. Three of the smaller companies, once active in the region, have either been forced out of business or handled no sand during 1906.

As reported by Consul-General G. E. Anderson,[5] the exports of monazite in 1906 were 4,787 tons, valued at $480,843, as compared with 4,881 short tons, valued at $485,184 in 1905.

The federal authorities of Brazil continue to charge 50 per cent. on exports of monazite, and the quality of the sand obtained is not so good as formerly. Exporters state that they can not ship their monazite to the United States, since the tariff of 6 cents per pound for 5 per cent. thorium constituent is prohibitory.

Africa.

The monazite deposits of the Oban Hills and of Kukuruku Hill of Southern Nigeria,[6] Africa, were still further investigated during 1905. So far the Oban Hills have yielded the richest samples.

Russia.

In Russia the discovery of rich deposits[7] of thorium-bearing mineral has lately been reported in an abandoned mine in the province of Perm.

Malay States.

The occurrence of monazite with alluvial tin ore has been reported at Pahang in the Malay States.[8] A sample of the tin concentrate contained about 13 per cent. monazite with a content of 8.38 per cent. thoria. This monazite does not much resemble the sand from the Carolinas and Brazil, since the grains are of an opaque whitish color. It should pay to separate this monazite magnetically before the tin ore is smelted, for the thoria content is unusually high.

South Australia.

A recent report in the (London) Mining Journal[9] tells of the finding of monazite in South Australia, on Kangaroo Island, about 30 miles from Kingscote. This discovery has not been authenticated as yet.

Ceylon.

During 1905 there was considerable prospecting for thorianite in Ceylon,[10] resulting in the finding of numerous small deposits and an of 17,900 pounds, valued at $24,110. Thorianite is a new mineral, discovered in 1904 in Ceylon. It carries from 70 to 80 per cent. of thoria, and has a specific gravity between 9 and 10. Thorianite has been discovered in almost microscopic crystals in the sands of various rivers and is found to be widespread occurrence in Ceylon. The matrix has not yet been discovered, though the pegmatites, cutting the acid leptynites of the region, have been suggested as the possible source. Besides thorianite and thorite, monazite has been discovered in the river gravels of Ceylon. In some places gold is found with these thorium-bearing minerals, and it seems the deposits could be profitably worked with mechanical separators for their several valuable minerals. According to Consul William Morey,[11] of Colombo, the exports of thorianite during the first three months of 1906 showed a falling off, for only 1,110 pounds, valued at $2,525, were shipped. About 100 pounds of thorite, valued at $97 were shipped in 1905.

Zircon.

The demand for zircon has not been large, and has generally been met in the United States by the intermittent working of the Jones and other mines near Zirconia, Henderson County, N. C. At these places the zircon is found in bodies of pegmatite out cropping along the top of a hill for a distance of over a mile. The zircon occurs in simple tetragonal crystals of small size, up to one-half inch square and 1 inch in length. There are a number of associated minerals, among which are many of those carrying rare earths, as xanthitane in abundance, with some titanite, titaniferous garnet, polycrase, allanite, auerlite, monazite, xenotime and cyrtolite. other minerals are orthoclase in crystals, epidote, staurolite, stilbite, magnetite, apatite, quartz and decomposed hydrated mica. The formations are badly weathered and are readily excavated through the shallow depths of most of the workings. The zircon is separated from the decomposed matrix without much difficulty by rough crushing and washing.

As already mentioned, zircon, in small, clear crystals can be obtained in quantity as a by-product from much of the monazite concentrates. A clean separation can be made with electrical machinery and by careful washing. With this object in view the concentrating plant of the United States Geological Survey at Chapel Hill, N. C., is at present engaged in making careful tests as to the best method of separating zircon, garnet, and other products of commercial value from monazite concentrates.

The output of zircon in 1906, amounted to about 1,100 pounds, valued at $248, and it all came from Henderson County, N. C. There was a call for several tons of zircon during the last part of 1906, but a supply could not be obtained before the close of the year. This demand has increased, and zircon is being mined during the present year as fast as possible to fill orders.

Production.

The production of crude monazite sand in the United States during 1906, amounted to about 2,000,000 pounds, which averaged about 30 per cent. monazite. Of this quantity North Carolina contributed about five-sixth and South Carolina furnished the remainder. The grade of this was so variable and the prices realized on different lots were so irregular that it has been found safer to estimate the quantity of monazite produced as concentrates. This is especially true since the greater part of the output is cleaned by local mills in the region before shipping to the manufacturers and the grade is brought up to at least 80 per cent. monazite. Estimating the quantity and value of all the sand produced in 1906 on an 80 per cent. basis, the production was: North Carolina, 697,275 pounds, valued at $125.510; South Carolina, 148,900 pounds, valued at $26,802—at total of 846,175 pounds, valued at $152,312.

The following table gives the production and value of monazite from 1893 to 1902, inclusive; of monazite and zircon in 1903; of monazite, zircon, gadolinite and columbite in 1904; of monazite, zircon and columbite in 1905; and monazite and zircon in 1906:

Production, in pounds, of monazite in the United States, 1893—1906.

Year.	Quantity.	Value.
1893	130,000	$ 7,600
1894	546,855	36,193
1895	1,573,000	137,150
1896	30,000	1,500
1897	44,000	1,980
1898	250,776	13,542
1899	350,000	20,000
1900	908,000	48,805
1901	748,736	59,262
1902	802,060	64,160
1903	[1]865,000	65,200
1904	[2]715,999	85,038
1905	[3]1,352,418	163,908
1906	[4]847,275	152,560

[1]Including 3,000 pounds of zircon, valued at $570.

[2]Including the small production of zircon, gadolinite, and columbite.

[3]Including a small quantity of zircon and columbite.

[4]Including 1,100 pounds of zircon, valued at $248.

The greater quantity of monazite sand recorder for 1905, as compared with 1906, without a corresponding excess of value, is due to the fact that in 1905, the quantity represents in part concentrates and in part crude sand, while the production for 1906 is placed on the basis of concentrates.

Imports and Exports of Monazite.

According to the Bureau of Statistics, of the Department of Commerce and Labor, there were no imports of monazite or other thorium-bearing minerals into the United States during 1906. A considerable quantity of thorium nitrate, however, has been imported during the last five years. The quantity and value of thes imports are given in the following table:

Year.	Quantity.	Value.
1902	42,815	$131,350
1903	64,520	232,155
1904	58,655	232,155
1904	58,655	249,904
1905	52,378	269,504
1906	40,000	139,929

Considerable monazite was exported to Germany and England in 1906. This was high-grade sand in each case, and amounted to from one-fourth to one-third of the output of the United States.

Prices.

The price of thorium nitrate has shown some remarkable variations during the last thirteen years, as appears in the following table:[12]

Prices (per kilogram of 2,2046 pounds) of thorium nitrate, 1954-1906.

Early in 1894	$476.00
January, 1895	214.00
July, 1895	119.00
November, 1895	71.40
May, 1896	35.70
October, 1896	21.40
October, 1899	7.14
Later, and in 1905	12.61
January, 1906	6.43

The prices paid for crude monazite in the North Carolina and South Carolina mining regions varied from 1½ cents per pound for very low-grade concentrates

with small thoria content to 15 or more cents for the better grades. The average price was nearly 8 cents per pound.

COAL CUTTING BY MACHINERY.

(Science and Art of Mining.)

Last year coal was raised from 3,295 mines in Great Britain, as against 3,461 in 1902, and the number of machines at work was 1,136, as against 483, a clear gain during the period of 653 cutters. From this it will be apparent that machines are rapidly growing in favor, a considerable proportion of the increase being recorded in the East and West of Scotland, Yorkshire, the Midlands and Durham. The driving or motive power continues to be a debatable point. In Scotland electricity is chiefly in favor, 171 machines being so driven as against 134 by compressed air, and from the inspector's reports it is ascertainable that every year electricity is making headway most rapidly across the Border. On the other hand, in the Newcastle and Durham districts combined, which are nearest to Scotland, compressed air is the power for 140 machines, as against 79 driven by electricity. Again, there is an almost similar proportion —158 to 94—in Yorkshire, whilst in Lancashire (Manchester and Liverpool districts) the disparity is most pronounced, being 146 driven by compressed air to 14 only by electricity. In explanation Mr. H. Hall, His Majesty's inspector, says that machines driven by electricity are found to be less reliable than those actuated by compressed air. In the Midland district the position is curiously even, 70 machines by the one power and 70 machines by the other being the exact record. The total coal production of the United Kingdom last year was in excess of 251 million tons; in 1902 the output was about 227 1-2 million tons. The machine-mined coal in 1906 was 10,202,506 tons, and in 1902, it was only 4,161,202 tons. A simple calculation shows that though the experimental stage has been passed the production per coal cutter has but slightly increased from 8,615 to 8,981 tons. The increase in the number of machines and the total output therefrom is therefore more significant than the amount of coal obtained by each machine, the reason probably being that a great many machines were started too late in 1906 to affect the output appreciably. A broader view of the question of coal cutting machinery is now being taken, and the usual apology of which we heard so much ten years ago, that the miners objected to the use of the machine even under favorable conditions, has not the same force today. It is satisfactory to note that whereas in 1902 only one ton in about fifty was machine-mined, last year the proportion was one in twenty-five.

EXCHANGES.

The Dusseldorf correspondent of the *Iron and Coal Trades Review*, November 15th, remarks that a large reduction in the German coal output per miner has recently been noticeable. The miners' unions are mentioned as a possible cause of this. The iron and steel market is developing unfavorable symptoms. The expected increase in the export trade of the United States is influencing the German market appreciably.

The Ottawa correspondent of the London *Mining Journal*, whose letter dated October 22nd appears in the issue of November 2nd, does not observe that nice distinction between fact and fancy that is at least desirable in mining correspondence. In a Larder Lake item he states that the "long winter in this region has begun." This is incorrect. The canoe route to Larder City was open until October 28th. On November 1st the weather was mild and there was no sign of snow. On the succeeding day rain fell. Another item gives favorable mention to the Crawford property, which is thirty miles or more from Larder district. The boldest man should hold his breath for a long time before speaking commendingly of the Crawford mine. Our venerable English contemporary should appoint a Canadian censor. Canada's climate has been sufficiently misrepresented. Also it would be well for our London namesake to see that it does not lend its columns to very doubtful promotions. The letter referred to gives prominence to more than one wild cat. "The oldest, most influential and most widely circulated journal" must walk more circumspectly. Verbum sap.

The *Engineering and Mining Journal*, November 16th, contains an instructive editorial on the lead market. The depressed condition of this market had induced the American Smelting & Refining Company to curtail production. But the largest independent producers have refused to follow suit. The stocks of refined metal have increased to the large total of 30,000 tons, despite the efforts of the trust. "It has been fully recognized that . . . the apparently successful regulation of the price of lead," our contemporary adds, "by the American Smelting & Refining Company was based on a generally rising market; and that the test of its control would develop on a falling market."

The *Iron and Coal Trades Review,* November 8th, reviews in an editorial the steel trade position and prospects. Referring to the United States, it points out that, since 1904, so great has been the demand for pig iron that blast furnaces have been run with only a minimum of repairs. Now that prices have dropped it is fully probable that many furnaces must be put out of commission. Moreover, after a long campaign the relining of many stacks is imperative. These and like reasons indicate that the output of pig iron predicted for the States for 1908—30,000,000 tons— is excessive. Hence the danger of dumping is minimized by these considerations. "The world's appetite for iron and steel is growing and not shrinking, and Great Britain is by no means yet played out as an iron-producing and steel-manufacturing country."

In the *Engineering Magazine,* November, A. Selwyn-Brown writes on the world's tin mining industries. The

limited and almost stationary annual output of tin ore and the gradually increasing value of the metal have brought about many economics and inventions in tinning processes. Nowadays very little tin is wasted. There is not now an important tin-producing mine in operation in any part of North America. Of Africa the same can be postulated. Cornwall and small districts in Spain and Saxony are responsible for Europe's output. Excluding Cornwall, the Malay Peninsula, Bolivia, and Australia are the most important tin mining countries. There is a lack of agreement in official estimates of the world's total output of tin. It is probably about 85,000 long tons per annum. Of this the Straits Settlements may be credited with at least 55,000 tons. Bolivia ranks second with 14,700 tons; Australia, 9,300, and England, 4,920. The Straits Trading Company, an English corporation, has a large tin smelter at Singapore, which reduces most of the tin mined in the Orient. Curiously, the shares are largely held by Chinese merchants. The exhaustion of the easily worked surface deposits and the scarcity of Chinese coolie labor tend to hold back the output. In Siam and in the Chinese provinces of Yunnan and Kwangsi large amounts of tin ore are mined. In Bolivia the most important deposits are situated at an altitude of 15,500 feet above sea level. The mines are worked at great disadvantage. Labor is scarce and unreliable. The ore occurs in porphyry veins traversing a series of clay schists. It contains between 3 and 10 per cent. metallic tin. In Tasmania is the greatest individual tin producer in the world—the Mount Bischoff mine at Waratah. It has paid $10,395,000 in dividends during the past thirty-four years. The proved tin fields of Australia are ample to supply the world's wants, and their slow developmest is due solely to the scarcity of capital.

At risk of being charged with impertinence to a senior, we wish to indicate once more to the *London Mining Journal* that its Canadian correspondent has missed his vocation. His proper and only calling is wool-gathering. A luminous paragraph appears in the Canadian letter of November 9th issue. "Grand Trunk Pacific officials, who have been on a tour of inspection, as far west as the coast, confirm the report of the discoveries of coal in this region." We respectfully suggest that the *London Mining Journal* should authorize its Ottawa correspondent to confirm the discovery of salt in the Atlantic.

PERSONAL AND GENERAL

Mr. George H. Gillespie, acting consulting engineer of the Trethewey mine was in Toronto on the 23rd November.

Mr. Robertson has resigned the superintendency of the Hub Colliery and will be succeeded by Mr. W. Wilson.

Mr. O. Frohnknecht, ore buyer of Frankfort and New York, is visiting Nelson and other Western mining centres.

Mr. James D. Hurd, the new manager of the Crow's Nest Pass Coal Company took up his duties on November 16th.

Mr. E. M. Sandilands, a resident of Sandon, B. C., for many years, has been appointed Government Agent for the Moresby Island mining district.

It is reported that Mr. J. R. Blackett has been offered and has accepted the post of comptroller for the North Atlantic Collieries Company, of Port Morien.

Messrs. H. H. Melville, vice-president, and H. M. Johnson, consulting engineer of the Dominion Copper Company, recently visited and inspected the company's mines and smelter in the Boundary district.

Mr. D. Davies, who for some years past has acted as comptroller of the Crow's Nest Pass Coal Company has resigned that position, and will be succeeded by Mr. A. Klauer, heretofore employed as chief clerk in the company's office at Fernie.

Mr. I. Patterson, president of the Nickel Copper Company of Ontario and of the Nickel Steel Company, of Canada, recently visited Sudbury on business in connection with the sale of properties in this district to the Booth and McFadden syndicate.

Mr. Geo. S. Waterlow, of London, England, a director of the Rossland-Slocan, (B. C.) Syndicate, owning the Snowshoe mine in the Boundary district and other properties in British Columbia, is in Montreal, where he will remain for a week or so before visiting the West.

The Dominion Coal Company has recently created new offices on its engineering staff. Thus Mr. R. J. Bell, formerly of Port Hood, has been appointed assistant district mechanical superintendent at No. 2 and No. 4; Mr. Maxwell of No. 9 and Mr. Connors of the international.

At the annual meeting of the Pathfinder Mining Company, held recently at Grand Forks, B.C., the following gentlemen were elected to offices: President, Mr. W. K. C. Manley; Vice-President, Mr. G. H. Rutherford; Secretary, Mr. R. F. Petrie; Directors, Dr. Kingston and Messrs. T. Newby and A. W. Fraser.

Mr. R. G. Drinnau, for four years general superintendent of the Crow's Nest Pass Coal Company's mines, has resigned that position to become general superintendent of the mines of the Pacific Coal Company at Hosmer. Before leaving he was presented with a silver service, a fur coat and a purse of gold.

The retirement of the Hon. George A. Cox from the presidency of the Crow's Nest Coal Company is announced. Senator Cox has served the company in the capacity of President for a period of ine years. He is succeeded by Mr. G. G. S. Lindsay, K.C., who from his connection with the company as general manager is exceptionally well qualified to assume the presidential duties. It is understood that Mr. James D. Hurd, of Duluth, a mining engineer of long experience, has accepted the appointment of general manager, while Mr. R. M. Young has been appointed secretary to the company.

Mr. John Hopp, who is largely identified with mining in the Cariboo district, is reported as having stated that hydraulicing operations in this district during the past season were exceptionally satisfactory, the yield having considerably exceeded that of 1906. Mr. Hopp also expressed the opinion, that ere long lode mining would become an important industry in Cariboo, the indications of the occurence of gold in quartz and also of rich copper ores being most favorable.

A further effort by the United States Government to discountenance wild-cat mining schemes is evidenced in the prosecutions iniated by the Post Office Department against the promoters of a New Mexico concern on the charge of using the mails to defraud. The prosecution resulted in the conviction of the accuser, who received severe sentences, and it is likely that other flagrant instances will be brought to the attention of the authorities to be dealt with in the same manner.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

Glace Bay.—With this week the St. Lawrence shipments will be rapidly approaching a close for this season, and it is to be feared that the shortage in shipments will be considerable. This shortage is due to one cause only, and that is a lessened rate of production per man. There has not been this Summer any real shortage of labor so far as the number of names on the colliery rolls, or the organization of the working forces of the mines is concerned, for this has been in excess of any former years. But for some reason or other the producing capacity of the miner has gone down, and to-day it takes more men to do a given amount of work, than it did say five years ago. This phenonema is not confined to Cape Breton, for it has been noted the world over. In a recent editorial in the "Iron Age," this matter was referred to, the writer saying that while employers of labor did not blazon this fact, yet in all their councils it came up for consideration, and was causing them more perplexity than any other distrubing factor in business circles at the present time. We do not care to attempt to explain this fact, but a fact it is, and one that must be recognized.

The Hub Mine is now clear of water, and it is expected that hoisting will recommence very shortly. The mine has been idle since the 14th of last December. This is the second time the mine has been pumped out.

The Fire Brigades from the various collieries competed on the night of the 16th for the Fergie Cup, a trophy that was donated by the Coal Company's superintendent of mines, and which has given rise to much emulation and rivalry among the different colliery teams. The trophy was won by the Hub team, after a keenly contested fight, that was watched by a most enthusiastic crowd of spectators and partisans. This kind of rivalry and sport is healthy and commendable and much praise is due to the Manager's Association, which had charge of the arrangements.

The local papers announced that Mr. Alexander Dick had resigned his position as general sales agent of the Dominion Coal Company. So far no confirmation of this statement has been forthcoming, and it has been received with very general scepticism.

The Coal Company's Rescue Station at No. 2 colliery is complete with the exception of the interior fittings. The instructor, Mr. James MacMahon has arrived from England, where he has for many years been connected with breathing apparatus work and drill. Before coming to Glace Bay Mr. MacMahon spent several weeks in Germany, where he visited the Draeger factory at Lubeck, and all the important Rescue Stations in Germany. After Mr. MacMahon has acquainted himself with the general layout of the Coal Company's mines, and has got the equipment into order, he will proceed to organize and train the corps in the use of the apparatus. There is every reason to suppose that this work will be taken up as enthusiastically as the fire brigade exercises, that at present are becoming so popular round the mines. It is also anticipated that a certain amount of ambulance and first aid work will grow up in connection with the Rescue Station, and some day it is hoped the Coal Company will have fire brigades, ambulance corps and rescue squads properly organized and affiliated and ready for the emergencies that may any time arise in the work of coal mining.

Work on the new developments at Victoria and on the railway is going along steadily, and if the present fine weather continues considerable progress will have been made by Christmas.

Coal finds are still being reported from Antigonish, and we understand Mr. A. C. Ross, M.P., has taken up large areas in the vicinity of the reported finds. Mr. Ross has some little reputation for shrewdness in this kind of thing, and there may be something in the reports. If Mr. Ross does not own valuable mineral areas it will not be for want of trying.

The Mining Schools inaugurated this session by the Nova Scotian Government are making good progress. At Glace Bay the work is in charge of Mr. John Macdonald, late chief surveyor of the Dominion Coal Company. Classes are being held in elementary subjects in English, in mechanical and plan drawing, in engineering and mining, and are being well attended. Similar schools are being held in Sydney and Sydney Mines, and the beginning so far augurs well for their continued sucess. As to the necessity of these schools, there can of course be no doubt.

NEW BRUNSWICK.

The Dominion Iron & Steel Company have succeeded in securing a lease of the iron ore deposits at Lepreaux, New Brunswick, and operations will be started at the earliest possible moment. Axel Auderberg, the Steel Company's expert engineer, was in St. John on Tuesday, November 19th, and left directly for Lepreaux.

This information was furnished by Mr. Peter Clinch, of St. John, N.B., who is associated with the New Brunswick Iron Company, from whom the lease already referred to was obtained. The Steel Company will pay Mr. Clinch's company twenty-five cents per ton for all ore mined by them from the Lepreaux holdings. The Government is to receive a royalty of five cents per ton.

Just how many men will be employed at the mines or when operations will be started is not as yet definitely known, and at the present time Mr. Clinch is only aware of the fact that the preliminary drilling is to be done by contract.

The deal was put through recently by C. V. Wetmore and, for the Province of New Brunswick, is a very important transaction. Future developments are awaited with interest and further particulars will be furnished in the next issue of The Canadian Mining Journal.

In respect of mineral wealth, New Brunswick is inferior to Nova Scotia, but it posesses some valuable ores and there is an abundance of excellent stone. Coal is found at many points in the southern portion of the Province and is being worked at Grand Lake and in two or three places in Kent County. The seams are thin, but close to the surface and easily reached. Albertite is found in Albert County. Bituminous shale is found along with petroleum. Petroleum wells are being operated in Westmoreland County. Iron is found in many parts of the Province and has been worked extensively in Carleton County. Copper ore exists in large quantities and has been worked in Westmoreland County. Deposits of nickel, antimony, galena, manganese and graphite are also to be found in New Brunswick.

The Province is abundantly supplied with limestone, the most valuable deposit being in St. John County. Gypsum is found in large quantities and is extensively quarried in Albert County. Large quantities of granite are also found in various parts of New Brunswick—at Hampstead, in the Nerepis valley, and near St. George, in Charlotte County. In certain localities marble is to be found. Freestone suitable for building purposes and for the manufacture of grindstones and millstones is also found in many parts of the Province. There is an abundance of slate and in most of the counties clay is to be found for the manufacture of bricks. Mineral springs are numerous, the principal ones being in King's County, where salt springs are also to be found. The latter are now being profitably operated.

The value of the mineral products of the Province of New Brunswick in the year 1900 is stated in the last census returns at $650,679, as will be seen from the following statistics:—

MINING IN NEW BRUNSWICK.—CENSUS OF 1901.

Classes of Products.	Value of Products.
Metallic ores and products	$100,000
Abrasive products	38,400
Fuel and light material	17,479
Structural materials of stone and clay	262,408
Miscellaneous products	232,392
	$650,679

The Drummond Mining Company of Montreal have secured a lease of rich iron mining areas in Gloucester County, New Brunswick, and will immediately take steps to develop the property. The deal was put through in Montreal early this month by Messrs. T. M. Burns, M.P.P., and William Hussey, of Bathurst, who hold the property under lease from the Government, and it is understood that they are to receive a sum in the vicinity of $80,000 for their interest.

Mr. Burns confirms the statement that the deal was put through at the Canadian metropolis. Their development by a strong company will mean much to the people of the county. Mr. Burns expressed the belief that as far as New Brunswick is concerned this is the most important mining deal ever consummated.

The property referred to is located near the Nepisiguit River, about eleven miles from Bathurst. The ore is very rich and heavy outcrops are visible. A recent test, made by an expert engineer, showed a depth of 320 feet of solid iron ore. It will, no doubt, take a great many years to exhaust the supply.

In order to properly develop the mines it will be necessary to construct a branch line of railway to connect with the I. C. R. at Bathurst. Mr. Burns has decided to have a delegation wait upon the Minister of Railways in the near future and apply for a subsidy. An application will also be made to the Provincial Government for assistance.

Fred. R. Taylor, of the law firm of Weldon and McLean, St. John, N.B., appeared before the Provincial Government at Fredericton on Tuesday evening, November 5th, for Col. Calhoun, of New York, of the Albertite, Oilite & Cannel Coal Company, asking the Government to settle the terms of a lease of shale deposits in Albert County.

The company offers to spend $100,000 in development in three years, and to pay $300 annual rental if they can secure a one hundred years' lease of the territory, which covers about 200 square miles. They propose to work things on a royalty basis of 10 cents per ton for shale and $1 per ton for Albertite. The principle of the lease was decided when Hon. A. T. Dunn was in the office of Surveyor-General, and the Government is to take the matter into consideration at an early date.

QUEBEC.

QUEBEC.—Many years ago alluvial gold was found in the valley of the Chaudiere River (Beauce County). About two million dollars worth of gold was taken out from the Gilbert River diggings. A great deal of prospecting has been done to discover gold quartz in place, but without success. Last summer, however, in the Township of Marston, near Lake Megantic, a farmer while ploughing struck a vein of quartz showing sights of gold. A mining license was taken out and this fall a small syndicate called "The Marboro Gold Mining Syndicate" was organized amongst local people. The occurrence may be described as a band of quartzite and quartz conglomerate interbedded between the stratification of the slate and intersected by numerous veinlets of quartz. Many of these veinlets contain visible gold. The dirt from drilling shows numerous coarse colors along with some fine colors. The reef itself has a width of seventeen feet. The prospect is a significant one. If the whole body is good for milling it will be the first commercially important gold-bearing quartz discovered in place in the Chaudiere River district. Prospecting will be renewed vigorously next summer.

The asbestos mines are in full operation, the market demand for their product continuing good. The district of Broughton is developed on a large scale for the treatment of fibrous serpentine. Three large mills are working. The last one to be started is owned by the Eastern Township Asbestos Company. Two more mills will be built there this winter by the Frontenac Asbestos Company and the Boston Asbestos Company.

The Chrome ore mines of Colraine are also in operation, and deep mining is being undertaken by the Black Lake Chrome & Asbestos Company.

The Ottawa mica district is working steadily. A fair price is still obtainable for small mica.

The Hull cement works is to increase largely its production.

Natural gas is being used for power purposes in the district of Three Rivers, as mentioned at length in the annual report of the Provincial Bureau of Mines.

ONTARIO.

COBALT.—The Copper Cliff smelter's change of arrangements in receiving ore is a topic of importance to producers of ores. The system heretofore has been to pay cash for ores in fifteen and forty-five days. In future twenty-five per cent. will be paid in forty-five days and the remaining seventy-five per cent. in ninety days. In place of a cheque payment will be made in silver bullion. Apart from friction and temporary inconvenience, this action, though drastic, will have the effect of steadying things and encouraging a larger production.

La Rose mine in the week ending November 23rd shipped twenty-two cars of ore. More than this could be shipped were the supply of cars sufficient.

On the Cobalt Central the concentrator is running steadily. A night shift is now working as well as a day shift.

The Cobalt Central has announced an offer of a $1,000 reward to any persons discovering a vein on its properties. It stipulates. however, that the vein must have been a silver content of at least 500 ounces to the ton.

The Silver Queen has reduced the number of its employees to eighteen. Drilling will be done on day shift only. Wages are being cut considerably.

ALBERTA.

FRANK.—The Canadian-American Coal & Coke Company, of Frank, Alta., and Wm. McVey, fire boss in the employment of the said company, were each fined for a contravention of the Coal Mines Act. It appears that the company had employed McVey as a fire boss, while McVey was not the holder of a fire boss certificate, as required by the mining laws of the Province.

BANKHEAD.—The briquetting plant installed a few months ago by the Bankhead Mines, Limited, which produces 300 tons of briquettes in 24 hours, is being duplicated, as the plant has proved such a success.

This company is also installing a new ventilating fan and boilers of the most approved type at their air shafts, which are driven out to the surface on the side of the mountain, where the coal outcrops.

COLEMAN.—Messrs. A. C. Flummerfelt and H. N. Galer, president and vice-president of the International Coal & Coke Com-

pany, of Coleman; of the Alberta Coal Company of Lundbreck, and the Royal Collieries of Lethbridge, have taken over the mines of the Breckenridge and Lundbreck Coal Company in connection with their other undertaking near Lundbreck, viz., the Alberta Coal Company. The Breckenridge and Lund mine has never been fully developed, but the new owners intend pushing forward development work with all speed. The coal to be produced is a domestic coal, which will be shipped east and sold in the prairie towns along the railway.

HILLCREST.—The Hillcrest Coal & Coke Company, Limited, which was fined $200 recently for locking out some of their miners in contravention of the Lemieux Act, has appealed the case, claiming that the text of the notices posted at the mines prior to closing down did not constitute a lockout. It is anticipated that the labor troubles at Hillcrest, which have been of long duration, are about to be settled, and while the final settlement is being adjusted the men are once more back to work and the mine running to its full capacity.

LETHBRIDGE.—Again the Lemieux Act, which by this time is known to every man, woman and child in our Western coal mining camps, has been brought to bear on a difference arising at Lethbridge between the Alberta Railway & Irrigation Company and their employees. The dispute in this case hinges on the very important point whether a pony driver's work in the mine commences at the time he starts to harness his horse or at the time he reaches his switch and commences to haul coal.

The company was represented on the Arbitration Board by Messrs. George Hatch and Hugh McBeth, the miners by Messrs. Fred. Hopkins and Thomas Biggs.

In the case of the Alberta Railway & Irrigation Company's mines, the face of the coal has advanced a long distance away from the bottom of the winding shafts, and in many instances the stables are situated a mile away from the working places, so that a considerable time elapses between the time the driver harnesses his horse and the time he reaches his appointed station to commence hauling coal. The men claim they ought to be paid from the time they leave the stables, while on the other hand the company claim the men's pay begins when they reach their working places.

President Hamilton of the miners' local union testified that where he worked in Indian Territory in a non-union mine, the pay started when the harnessing of the horses began.

DIAMOND CITY.—The Diamond Coal Company are opening a new mine on an extensive scale at Diamond City, which is in the Lethbridge district. At present this coal camp has no railway connection, but when the high level bridge on the C. P. R. is built they will have direct communication with the Crow's Nest branch.

The mines will be laid out to produce 1,000 tons per day of domestic coal. At present the machinery for the new plant is being hauled in from Leavings, a distance of 30 miles. Leavings is a station on the McLeod to Calgary branch of the C. P. R.

BRITISH COLUMBIA.

HOSMER.—A sad accident caused by an explosion of dynamite occurred at the Hosmer mines, whereby three miners, Harry Montelbetti, Joseph Lichazt and J. Matawish, lost their lives.

FERNIE.—At a meeting of the directors of the Crow's Nest Pass Coal Company Senator Cox resigned the presidency, his place being taken by G. G. S. Lindsay, K.C., who has been general manager for some time. Jas. D. Hurd, of Duluth, succeeds Lindsay in the general managership. G. G. S. Lindsay was at the same meeting advanced to the office vacated by the retirement of Geo. A. Cox, with the understanding that as chief executive officer he devotes all his time and attention to the duties of the position, and as this in turn involves the appointment of a new general manager, that office has been filled by the selection of James D. Hurd, a mining engineer of long experience. Mr. R. W. Young becomes secretary.

THE KOOTENAYS.—The dark shadow which has been hanging over this district for some time past settled on the Boundary country this week when the mines of the Granby, British Columbia Copper and Consolidated (Snowshoe) Companies ceased operation simultaneously, and the fires were gradually drawn from the Granby and other smelter furnaces.

Rumor has it that the Rossland mines and possibly other properties and industries related thereto will follow suit, but there has been no action taken at the time of this writing, and it is hoped that no such a situation will occur. It is argued, and with some logic, that while the Boundary mines are mostly low grade copper propositions, the Rossland properties, though still lower in copper, have a preponderance of gold, average ore running approximately one-half an ounce of gold ($10), which is naturally nt affected by present conditions; one ounce of silver (58 cents) and one per cent. or a little under of copper ($2.60). So it is anticipated that if supplies, etc., come down in price the mines on Red Mountain will be able to continue work and realize a good profit on their production.

Numerous elements have brought about the train of events that has culminated in this action by the Boundary mines. The cardinal point, of course, has been the big drop in the price of the metal they are mining, copper; then there has been an increase of from twenty to about forty per cent. in the cost of supplies of every kind for use in mining and smelting; increased cost of labor, etc. This condition of affairs could be tolerated to a greater or less extent with copper above twenty cents per pound, but when copper slumped and the other costs remained the same it placed the mining companies between Scylla and Charybdis. They chose what they considered the lesser evil and closed down, awaiting a more equitable adjustment of conditions.

It is felt that this phase of the present situation will not be of long duration, and that the mines will start up again in a month or so. At least we all hope that this will be the case. It is rumored that when work is begun again the wages offered will be on the old scale; that is, $3.50 for miners for eight hours' work, instead of $4 as they have lately been getting, and so on down the line. It will probably mean a reduction of about twenty per cent. in wages from what they have been getting here lately. Most of the miners do not object to this step backward, as it were, and it is not anticipated that there will be any friction caused by a move of this kind.

Many of the miners have taken advantage of the close-down to take long looked for holiday trips to the Old Country and to their homes in Eastern Canada and the United States. Owing to there being a superfluity of labor at coast points and other parts of the Province most of the miners are contenting themselves with staying in the Boundary district.

The Rossland mines have been shipping about the same quantity of ore as last reported. Development work is going on as usual, and the ore is showing up well. There are large quantities of ore in the Consolidated and Le Roi mines that have recently been blocked out, and the future looks bright for these mines if outside influences do not hold them in check.

Mr. Kiddie, the new manager of the Northport smelter, was in Rossland early this week, but had nothing to say in regard to smelter matters.

The cessation of ore shipments from the Snowshoe mine in the Boundary to the Trail smelter will probably cause the closing down of a couple of copper furnaces there.

Le Roi Company have ceased diamond drill work in the Spitzee, which property they have under bond in this camp. The company has not given out a report as to the success they had in their work on that property, but it can be taken for granted that it was not of a very brilliant nature, as the mine was examined

the other day by Mr. Alexandar Sharp, who is managing the First Thought mine near Orient, Wash., in the interest of the shareholders. Naturally Mr. Sharp was mum on the subject. Mr. Sharp is managing the First Thought mine for "Pat" Burns, the Calgary cattle man, who owns a controlling interest, and is making quite a success of the proposition.

Prior to closing down all of the Boundary properties were making record shipments, with the exception, of course, of the Dominion Copper Company, which had already closed down, and things were looking particularly well. For the week ended November 9th the Granby smelter made a new record, treating an average of over 3,200 tons of ore per 24 hours. Total shipments for that week from Boundary were as follows: From Granby mines, 22,080 tons; from Emma, 930 tons; Mother Lode, 3,397 tons; Snowshoe, 5,480 tons. The Snowshoe has been making very heavy shipments, reflecting credit on the assiduity of Superintendent Biesel.

Dominion Copper Company officials are expected in the Boundary at an early date. Warner Miller, president, New York; H. H. Melville, vice-president, Boston; M. M. Johnson, consulting engineer, Salt Lake, and probably some of the other officers will look over the situation on the ground. (Later—Melville and Johnson arrived at Boundary on November 13th and are looking over ground.) T. L. Dickason, of Chicago, president of the Crescent mine, is also expected at that property in the immediate future. This property is now equipped with a good electrically operated hoisting and compressor plant, and work will very likely be pushed forward earnestly from now on. The annual meeting of the Pathfinder Mining Company was held at Grand Forks early in the month. Officers were elected, and it was decided not to do any further development work on the property for the time being. A Grand Forks mineralogist discovered graphite within the city limits the other day, and a number of the citizens affected by the craze are having samples of the soil in their flower gardens tested.

The Spokane & British Columbia Railway, better known locally as "The Hot Air Line," which now runs trains from Grand Forks to Republic, Wash., is shortly to be built from the latter place to Spokane, Wash. This move should prove of much benefit to the Spokane & British Columbia, and will no doubt result in a much better position for this road in the railway world.

There is no doubt but that the Tulameen district as well as the Similkameen will be coming to the front in mining affairs in a very short time. Large ore deposits carrying tantalum, thorium and thallium have been located in the Champion Creek district.

A Denver outfit has put up $10,000 to prospect a platinum ore deposit near Slate Creek. Numbers of prospects are being worked in both of these districts and good strikes are reported daily.

Robt. Stevenson, of Princeton, is reported as going to develop a copper property on the Similkameen River this winter. If he makes as great a success of his mining as his namesake did with literature, that copper mine will surely turn out well.

Railway work was never more active in this district. Engineers are in the field making a survey of the proposed extension of the Nicola branch to Princeton. Good progress is being made on the V. V. & E. between Keremeos and Hedley. There is only a small force working on this, but it is expected that Hedley will be reached early in the spring. It is probable that a larger force will be put to work now that labor is a little more plentiful and the work hurried on. Nine feet of good bituminous coal have been located on the property of the Nicola Coal Company. There is not much doubt that when the Nicola coal fields have been developed to a greater extent valuable mines will be found there. Prospectors are cutting seams of coal right along in that country and things are looking better.

Travelling a little farther from home, another discovery of gold is reported from the vicinity of Cape Scott, Vancouver Island. Numerous claims have been staked, as usual. We hope that the find is of a substantial nature, and that its existence will not be of the same evanescent nature as other discoveries we have known. A number of the business men of this district are interested in the Telkwa and other northern mining fields. Travellers from the Telkwa country claim that the mines there are likely to equal if not surpass the Boundary propositions. If they do, then so much the better for British Columbia. Another proposition in the Tatlayoco Lake district attracting local attention is an antimony mine, carrying 67 per cent. antimony and some gold and silver, total values running approximately $209 per ton. There is also a quartz lead on the property running about $54 per ton in gold. A copper-bearing dyke on the claims varies from 75 to 200 feet in width, values averaging about $11 per ton. The property is in a development stage as yet. Of course "the north" is a big country, and we only hear of the richest of the mining properties, still some of the tales of wide and long ledges of rich copper and other ores that have been found and are being worked make a fellow feel like getting into his "diggin' clo'es" and "hiking" for the frontier.

The Alaska Treadwell Company treated 702,953 tons of $2.42 gold ore during the year ended June 1st, realizing $2.15 per ton. They paid 14 per cent. in dividends, or $700,000. They certainly have the art of ore extraction down pat at Treadwell, and can make very low grade ore pay, but it is naturally a much more amenable product than most of the mill men in this country have to struggle with.

The Arbitration Board in the Consolidated (St. Eugene) matter did not meet as expected owing to the bereavement of one of its members. Hence we cannot report the outcome of this question at this writing.

Robert R. Hedley, special commissioner, Department of Mines, Ottawa, is now in this country gathering data in reference to the Western mining industry. This is the proper way to secure reliable information. Much more can be done by a man on the ground in an hour than can be done through the mails in a month.

Slocan mines are steadily getting in supplies for the winter, and development work will be done on a number of properties all winter. The Westmount is about ready to ship a car of ore. The Reco mine is reported to have lots of ore in sight.

The Silver Dollar mine of Lardeau will ship a large quantity of concentrates now on hand as soon as the snow is in condition for "rawhiding." A Philadelphia company is doing some gold dredging at Gold Hill in the Lardeau near Poplar Creek, where the gold excitement was a few years ago. The outcome of the venture will be awaited with some interest by miners in this country.

Wm. Waldie, of the Queen mine, Salmo, in the Ymir district, has recently ordered an addition to his stamp mill. Mr. Waldie will yet make a good mine of the Queen. We must admire his pertinacity, which will no doubt achieve success in the end.

Work is proceeding as usual at the St. Eugene Mine, Moyie. A large force of men is being employed and the mine is looking well.

Chas. A Mackay, manager of the mine that is working in the middle of Moyie Lake, has his caisson shaft down about 80 feet and will begin pumping the water out of it at an early moment. The bottom of this shaft is now resting on 10 feet of clay. In a prospecting drill hole sunk on this property some time ago they got traces of galena ore from the bottom of the lake. If Manager Mackay gets the St. Eugene lead in the lake bottom the value of claims on the other side of the lake will be greatly enhanced.

The C. P. R. is reported as going to build that long looked for piece of railway from Golden to Fort Steel. Let us hope it is

so. This road would open up a very rich mining and agricultural country and would be a paying proposition all around. The C. P. R. Company has made extensive improvements at Cranbrook, which will aid them materially in handling the Crow-Spokane business.

One of the many mines that would be benefitted by the Golden-Fort Steel branch of the C. P. R. is the Giant mine near Golden, where they have recently installed an Elmore vacuum oil plant, with a capacity of forty tons a day. Other mines mines aided would be the Ptarmigan, Red Line, Paradise and others.

At a meeting of the shareholders of the Alberta Railway & Irrigation Company, held at London, November 7th, among other things the chairman reported that the common shares of the company would no doubt be placed on a dividend paying basis in 1907, which will be noted by the holders of such shares with much gratification.

As has been hinted for some time, a shuffle has occurred in the affairs of the Crow's Nest Pass Coal Company. Hon. Geo. A. Cox has retired from the presidency, and Mr. G .G. S. Lindsay, K.C., has stepped into his place. James D. Hurd, of Duluth, will be general manager, and R. M. Young will be the new secretary.

A banquet was tendered Mr. R. G. Drinnan at Fernie on the 14th November, prior to his departure for Hosmer, where he will shortly take charge. Mr. Drinnan is a very popular man on the Crow, which was duly manifested during the course of the dinner.

The coal mines have been busy, but it is expected that several of them will materially curtail their output or cease operation as far as coke and coal production for the Boundary is concerned.

GENERAL MINING NEWS

NOVA SCOTIA.

SPRINGHILL.—The miners of the Cumberland Coal & Railway Company have applied to the Department of Labor for a new conciliation board to investigate certain matters of difference between the men and the company.

The Springhill mines are now outputting about 1,400 tons of coal per day. Manager Cowans has hopes of catching up with back orders before the winter is over.

The mechanics employed by the Cumberland Coal & Railway Company quit work on October 2nd. This left the pumps and necessary power machinery of the mines unmanned. The officials of the company, however, came to the rescue and filled the vacancies. Men are to be sent by the Provincial Government to relieve the situation. Deputy Minister McKenzie King is now in Springhill.

HALIFAX.—Two hundred students are now in attendance at the Halifax Technical School. The movement for technical education is being enthusiastically supported by the people.

PORT MORIEN.—Thirteen square miles of coal areas adjoining the areas of the Cape Breton Coal, Iron & Railway Company (Broughton areas) are the subject of negotiations between the Dominion Steel and the Cumberland Railway & Coal Company. Three seams of good coal have been found on the areas.

SYDNEY.—Iis expected that the Dominion Coal Company will despatch the last coal-laden steamer up the St. Lawrence on or about November 23rd. Navigation usually closes about that time.

The Dominion Iron & Steel Company on November 18th made a new record by producing in 24 hours 1,086 tons of steel rails. A cargo of 4,050 tons of rails left Sydney yesterday by the Elder-Dempster liner Memnon for Quebec, to be used by the Transcontinental.

ONTARIO.

COBALT.—The McKinley-Darragh Mining Company has definitely reduced the wages of its employees. It is understood that there will be a general movement towards reduction of wages all over Cobalt. This is an inevitable effect of the present tightness of the money market.

Cobalt mining companies with head offices in the United States are being urged to establish transfer and registry offices in Toronto.

A movement is on foot in Cobalt to form a shareholders' protective association. By its aid rigid examination will be made of the administration of funds.

The Coniagas concentrator is handling between 60 and 70 tons of ore per day. The richest ore is first hand picked out. An extra Wilfley and a Wilfley slimer have been installed. The mine is employing a full force of 130 men.

The Buffalo mine has 120 men working regularly. .

The proposals of the Copper Cliff smelter have been thrown into definite shape thus: The right of sending back bullion instead of cheques is reserved; for ore carrying 4,000 ounces or over they agree to give the mine 94 per cent. of the value; 1,200 ounces, 93 per cent; 800 ounces, 92 per cent; 500 ounces, 90 per cent.; 300 ounces, 85 per cent.; and 150 ounces, 80 per cent. Ore containing 12 per cent. or over of cobalt will be paid for at $30 per ton; 8 per cent. cobalt, $20; and 6 per cent., $10. Within 45 days of the last day of sampling, the company promises to pay 50 per cent. of the amount due the mine, the balance being payable in ninety days.

PORT ARTHUR.—The first car load of silver ore shipped from the Beaver mine since reopening left Port Arthur recently. It was shipped to Omaha. A new mill will probably be erected.

The rumor that West End Silver Mountain mine was shut down has been officially denied.

BRITISH COLUMBIA.

ROSSLAND, B.C., Nov. 23.—Rossland Miners' Union held on November 25th a referendum vote for the purpose of determining whether or not the present scale of wages will be decreased to the scale which prevailed prior to July 1 of this year. The scale at that time provided for $3.50 a day for miners, instead of $4 as at present. Other workers around mines will have wages reduced in like proportion if the vote is in the affirmative.

The lower price of metals has cut down the profits of mines to such an extent that it is claimed they cannot be operated under the present scale and may close down if the scale of wages is not reduced.

The Granby Consolidated Mining, Smelting & Power Company wired from Grand Forks: Shut down is due to the low price of copper, the high operating costs and the united action amongst the large copper producers of America to curtail production and reduce the surplus of copper.

KASLO.—The market for zinc ores is improving. Recently the Whitewater mill sold 2,500 tons to a large Kansas reduction company. A contract was made for the entire output of the property for one year.

FERNIE.—Three men were killed by the explosion of a missed hole in an open cut at the Hosmer mines of the Pacific Coal Company. This is the first fatal accident to any of the company's employees in the district.

NICOLA VALLEY.—The Diamond Valley Iron & Coal Company is sinking a shaft to its principal seam. Three shifts are at work.

NANAIMO.—The Western Fuel Company broke all local records on Wednesday, November 6th, by hoisting 2,803 tons of coal from its No. 1 and Northfield mines. Of this amount the Northfield mine put out 1,238 tons.

CRANBROOK.—Three additional furnaces are to be installed at the smelter of the Sullivan mine, located at Marysville, B.C., as soon as financial arrangements are completed.

FAIRVIEW.—Work on the Canada Zinc Company's building and plant at Fairview is being rushed. It is hoped that everything will be in readiness to start in March. The electric reduction process, successfully operated in Sweden, has been materially modified and improved. If the plant proves a success the zinc-lead ores of Kootenay will at once go up in value.

VANCOUVER.—A syndicate of Vancouver and Victoria people is about to undertake the development of a group of seven copper-gold claims on Moresly Island. A plant, including a steam hoist, a twenty horse-power boiler and a Cameron steam sinking pump, will be shipped in the immediate future.

Reports have reached this city that the Cornell copper mine on Texada Island has been sold to G. L. Tanzer, a Seattle mining man. The Texada Consolidated Mines have acquired the Cornell from Mr. Tanzer, along with eight claims of the Raven Creek group. Two thousand feet of tunnelling have been done on the Cornell.

YUKON.

DAWSON.—Four hundred tons of dredge construction material must yet be received before the dredges of the Consolidated can be completed. There is now enough material on hand to complete two. Several million feet of lumber will be distributed from the company's sawmill at Twelve Mile. The old dredges on 104 and 90, Bonanza, were closed down on October 13th.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Commenting on the fact that one of the largest British railway companies has recently placed an extensive order for open-hearth steel rails, the *London Times* remarks that this will not occasion surprise to those who have followed this method of the manufacture of steel. That greater reliance can be placed on the product of the open-hearth furnace is now fully attested by the almost complete exclusion of Bessemer steel for structural purposes, and the specification of open-hearth steel for use in bridges and other structures has become so familiar as to be generally understood when the specification is silent upon the method of manufacture required. While it is not anticipated that the Bessemer converter will be completely superseded by the open-hearth furnace, the number of new works in Great Britain equipped for the manufacture of steel by the open-hearth process greatly exceeds those planned for the Bessemer process, and the demand for the former material is enormous in view of the extensive employment of structural steel for skeleton framework of buildings and steel plate for ships, boilers and engineering work generally.

The death of Mr. Forster Brown, one of the best known engineers in South Wales, has occasioned sincere regret. As an expert his advice was much sought after, and his opinion highly valued. The deceased gentleman was associated with the opening up of some of the most important collieries in the South Wales district.

At a public meeting recently Mr. Samuel, Under Secretary for Home Affairs, spoke on the subject of the Mines Regulation Acts. As to the proposed Mines Department, he said the work had now to be dealt with by the officers of the Industrial Department, which he considered wrong. The country ought to have a real Mines Department, with a chief inspector of mines continually devising new improvements. He had no doubt that the Royal Commission on Accidents would recommend the creation of a Mines Department, and he hoped it would be the privilege of himself and Mr. Gladstone to carry out the scheme.

Mr. Arnold Lupton, M.P., has published a pamphlet of the Eight Hours Bill, in which he refers to the fact that in two large collieries started by him with eight hour shifts underground, the colliers in each case requested that the hours should be increased to nine. In one case the change had the immediate effect of increasing the average earnings to the extent of a shilling a day, and based on this evidence he thinks that the average decrease in earnings following the adoption of an eight hours bank-to-bank day would not be less than two shillings a day.

According to statistics compiled by a well-known British firm, the world's production of pig iron during 1906 was 58,742,322 tons, an increase of nearly five million tons on the output of 1905. In 1906 the United States manufactured 25,307,191 tons; Germany, 12,422,177 tons; and Great Britain, 10,149,388 tons.

GERMANY.

Extensive improvements are contemplated in connection with the Krupp collieries, Hanover and Hannibal, no less a sum than seven million marks having been appropriated for the thorough equipment of the mines.

AUSTRIA.

Advices from Budapest affirm that the State has decided to acquire a number of collieries and has already purchased large areas of coal-bearing lands, which have not been properly exploited up to the present time owing to lack of capital and means of communication. In addition a colliery has been purchased in Croatia which is already producing 100,000 tons.

FRANCE.

Some interesting figures have been published on the cost of coal production in the Nord. Thus while in 1887 the annual output per man was 306 tons, the average annual wage was £44 6s. 4d., and the cost per ton 3s. 6d.; in 1906, the annual output per man was 261 tons, the average wage £58 13s. 8d., and the cost per ton 5s. 8 1-2d. In fact during this period there has been a gradual but persistent decrease in output per man accompanied by a steady increase in wages paid and in cost of production.

SWEDEN.

A Consular report states that about 4,500,000 metric tons of iron ore were produced in Sweden last year, from 308 mines. The gold production was, however, very inconsiderable, while lead was produced to the amount of 7,000,000 kg.; copper, 1,209,130 kg.; and zinc, 174,600 kg.

RUSSIA.

Intelligence has been received of the discovery of rich gold placers near Okhotsk, and several enterprises are already prepared to work them. The discovery, it is stated, of gold in the north-eastern possessions of the United States, in Alaska and on the Seward Peninsula, has been of great importance in the development of adjacent Siberian territory.

PORTUGAL.

Portugal produces, according to an official report just issuel, antimony, arsenic, anthracite coal, copper, lead, iron, manganese, tungsten, tin and zinc. The industry, however, is not yet established on a very important footing, since the total mineral output for last year is valued at only $1,803,380.

UNITED STATES.

For the nine months ending September 30, asbestos to the value of $798,301 was imported into the United States, the product being that of the mines of Thetford and Black Lake districts, in the Province of Quebec.

Nearly all the copper mines in the United States, following the example of Butte, have announced a reduction in miners' wages. Among others the principal mines in Arizona, notably Bisbee, Globe, Clifton-Morenzi and Jerome, have effected reductions, as have also a number of the large companies operating in the Lake Superior mining districts. Thus the Calumet & Hecla has announced a reduction of 12 1-2 per cent. in the wages of all classes of labor at the mines and mills, while in other cases a reduction of only 5 per cent. has been made. The Calumet & Hecla employs between six and seven thousand men. The miners, however, are not permitting the new scale to go into effect without protest, and a deputation has been appointed to request the company to make the reduction less severe.

Meanwhile iron mining in this region is very active, production during October constituting a record for the year, the output from the five ranges being approximately 6,400,000 tons.

The Couer D'Alene lead mines still continue to maintain a normal production, despite the unsatisfactory lead prices, while last month five companies paid dividends aggregating $576,000.

As a result of lower treatment rates conceded by the mill and smelter trusts, a largely increased output was made by the Cripple Creek mines last month, or 69,950 tons, valued at $978,086, as compared with 62,950 tons, valued at $944,200, for September. It is anticipated that the November output will realize $1,250,000.

The mineral production of the United States is shown in "The Mineral Resources of the United States," advance sheets of which have been issued, to have reached the enormous total value of $1,902,505,206, as compared with $1,623,928,720, an increase of 17 1-2 per cent. The two most important mineral products were coal and iron, the value of the former having been $513,079,809, and of the latter $505,700,000.

MEXICO.

The Government has under consideration the enactment of new mining laws, which have created much discussion among mine operators. The questions raised include the ownership of residues from reduction plants and mills, the disposition of the waters from the mines and mills, the subdivision of mining properties, and the registration of mining titles.

SOUTH AFRICA.

An effort is being made in London to secure additional capital for the development of platinum mines in the Albany district, Grahamstown, Cape Colony. Samples of the rock are said to assay as high as 17 oz. 16 dwts. platinum to the ton.

The Johanessburg correspondent of the *Mining Journal* (London) states that the advent of the Victoria Falls Power Company inaugurates a new era in the production of electric power on the Witwatersrand, and in some instances a load factor of over 90 per cent. is being regularly maintained.

An interesting paper on the "Origin of the Gold in the Rand Banket" was recently read before the Institution of Mining and Metallurgy by Prof. J. W. Gregory, wherein he arrives at the conclusion that the theory in best agreement with the facts seems to be that which regards the banket as a marine placer in which gold and black sand were laid down in a series of shore deposits. The gold was in minute particles, and it was concentrated by the wash to and fro of the tide, sweeping away the light sand and silt, while the gold collected in the sheltered places between the larger pebbles. The black sand deposited with the gold has been converted into pyrites, and at the same time the gold was dissolved and deposited in situ.

AUSTRALASIA.

A new copper field of great promise is reported to be developing in Cangai, in the Grafton district of New South Wales. The deposits are said to be of enormous size, while the conditions are such that costs are very much lower than in any other copper district in Australia. The metal is at present being obtained at a cost of $165 a ton, as compared with from $100 to $250 a ton in other New South Wales districts, of $66 a ton in Queensland and $350 in South Australia.

STATISTICS AND RETURNS.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ended November 15 totalled 22,043 tons, a daily average of 3,674 tons.

The output of the collieries of the Crow's Nest Pass Coal Company for the week ending November 22nd was 18,508 tons, a daily average of 3,085 tons. For the corresponding week of last year the output was 7,791 tons, a daily average of 1,298 tons.

Despite the shut down of the Boundary Mines and smelters in the middle of last week, the ore receipts at the smelters show a respectable total, to a large extent made up of ore in transit. It is generally considered that the shut down, for which as yet no cause has been assigned, is not likely to last.

Appended will be found the ore shipments in detail for the week ending November 16th and year to date in tons.

Boundary shipments—Week, 27,618; year, 1,139,708.

Rossland shipments—Week, 6,162; year, 242,935.

Slocan-Kootenay shipments—Week, 4,455; year, 143,125.

The total shipments from the mines in the above districts for the past week were 38,235 tons and for the year to date 1,525,768 tons.

BRITISH COLUMBIA SHIPMENTS.

Nelson, B.C., Nov. 23.—Following are the ore shipments and smelter receipts in Southeastern British Columbia districts for the week ending November 23 and year to date in tons:—

Shipments—	Week.	Year.
Boundary	1,273	1,140,981
Rossland	6,407	249,742
East of Columbia River	3,689	156,714
Totals	11,369	1,547,714
Smelter receipts—		
Trail	7,080	237,249
Northport	919	88,529
Marysville	600	28,200
Others	.....	1,110,079
Totals	8,599	1,464,057

DOMINION COAL OCTOBER OUTPUT.

Output.—No. 1, 52,569; No. 2, 59,241; No. 3, 34,036; No. 4, 56,269; No. 5, 43,707; No. 6, 19,719; No. 7, 14,277; No. 8, 26,542; No. 9, 38,655; No. 10, 4,994. Total, 350,009.

Total shipments, 306,108, approximate.

Dominion Coal Company's outputs for first half of November, 1907:—

No. 1, 24,900; No. 2, 34,180; No. 3, 16,120; No. 4, 27,300; No. 5, 27,510; No. 6, 11,440; No. 8, 10,340; No. 9, 18,360; No. 10, 4,050. Total, 174,200.

The mines during the week ending November 9th from the Rossland camp have shipped normally. There is a larger output than ever before from the Granby mine, which has a record week, but otherwise the Boundary mines have not improved recently. Great activity is being shown in the Slocan and in Kootenay mines generally in the silver lead and gold quartz districts. There are a far larger number of mines shipping than has been the case for some time past and new mines are being added to the shipping list every week.

Boundary shipments—Week, 32,233; year, 1,112,090.

Rossland shipments—Week, 5,775; year, 236,773.

Slocan-Kootenay shipments—Week, 4,191; year, 138,570.

The total shipments from the mines in the above districts for the past week were 42,109 tons and for the year to date 1,487,433 tons.

COBALT SHIPMENTS.

Cobalt ore statement for the week ending November 9th, to November 16th, 1907:—

La Rose Mine—To Denver, Col., Nov. 11th, 65,000; Nov. 11th, 45,000; Nov. 11th, 65,000; Nov. 13th, 53,000; Nov. 13th, 43,000; Nov. 14th, 44,000; Nov. 14th, 43,000; Nov. 15th, 66; Nov. 16th, to New York, 41,100; Nov. 16th, to Denver, 88,000; Nov. 16th, 66,000. Total, 619,100.

Nipissing Mine—To New York, Nov. 12th, 61,720; Nov. 14th, 60,570; Nov. 16th, 60,170. Total 182,460.

McKinley-Darragh Mine—To Penn. Smelting Co., Carnegie, 61,160; Nov. 15th, 60,110. Total, 121,270.

City of Cobalt Mine.—To American Smelting & Refining Company, Perth Ambody, N.J., Nov. 14th, 63,950; Nov. 14, 37,280. Total, 101,230.

Total—1,024,060.

Cobalt ore statement for the period November 2nd to 9th, 1907:

Nipissing Mine—To New York, Nov. 4th, 32,443; Nov. 4th, 41,127; Nov. 8th, 61,470. Total, 135,040.

La Rose Mine—To Denver, Col., Nov. 5th, 66,000; Nov. 5th, 66,000; Nov. 5th, 68,000; Nov. 7th, 40,000; Nov. 7th, 40,000; Nov. 8th, 65,000; Nov. 8th, 40,000; Nov. 9th, 40,000; Nov. 6th, 32,040. Total, 544,040.

O'Brien Mine—To Delore Mining Company, North Bay, Nov. 6th, 260,000.

Buffalo Mine.—To American Smelting & Refining Company, Denver, Col., 40,000.

Kerr Lake Mine—To Kerr Lake Mining Company, Perth Amboy, N.J., 62,040.

Total—952,120 lbs.

AVERAGE PRICES OF COPPER—NEW YORK.

Julius Matten, 25 Road Lane, London, E.C., supplies the following figures of the world's production of pig lead, in English tons: 1904, 985,069; 1905, 990,920; 1906, 975,610. In metric tons the figures stand—1904, 999,844; 1905, 1,000,784; 1906, 990,244. The year average prices of soft lead per pound in New York and per ton in London are:—New York—1904, 4.45 cents; 1905, 4.84; 1906, 5.78 1-2. London—1904, £11 19s. 8d.; 1905, £13 14s. 4d.; 1906, £17 7s. During the years the highest monthly average was obtained in December, 1906, being 6.08 cents and £19 12s. 6d.

Canada's porduction is given thus:—English tons—1904, 12,-143; 1905, 17,125; 1906, 16,991.

In 1906 the United States, Spain, Germany, Australia and Mexico were the chief producers. Canada comes eleventh on the list.

The following are the figures of German consumption of foreign copper for the months January-Steptember, 1907:—Imports of copper, 93,867 tons; exports of copper, 6,387 tons; consumption of copper, 87,480 tons; as against during the same period in 1906 of 91,340 tons.

Of this quantity 73,616 tons were imported from the United States.

Figures received from L. Vogelstein & Company.

Company Notes.

Butte Coalition Copper Company has reduced its quarterly dividend from 50 to 15 cents a share.

The annual meeting of the Nova Scotia Cobalt Silver Mining Company is called for Monday, December 2nd, in Montreal.

The annual meeting of the Coniagas Mine, Limited, was deferred until November 28th on account of the inability of Mr. Milton Hersey, of Montreal, to attend on the 26th.

At the annual meeting of the Pathfinder Mining Company, held a few days ago in Grand Forks, the following officers were elected: President, W. K. C. Manly; vice-president, G. H. Ruthford; secretary-treasurer, R. F. Petrie; board of directors, Dr. Kingston, Thos. Newby, and A. W. Fraser.

The Westinghouse Machine Company and the Westinghouse Electric Manufacturing Company have secured large Pacific coast contracts during the past week. The contracts total nearly $2,000,000. Both companies are in a decidedly easier position.

The November dividend of the Consolidated Mining & Smelting Company is, like the other six previously paid, at the rate of ten per cent. per annum, or two and one-half per cent. quatrerly, the same amount having been paid quarterly for the last twenty-one months. As the company has an issued share capital of $5,355,200, divided into 53,552 shares of $100 each, this last payment made the dividend disbursement amount to $133,880. Including the six dividends heretofore paid, themselves amounting to $714,945, the total amount thus far paid in dividends by this company amounts to $848,825.

The Waverley Hydraulic Mining Company declared a dividend of $5.50 per share at the annual meeting of the stockholders at Barkerville. This is 50 cents per share more than last year. The yardage moved was 27,200, of which 4,600 cubic yards was from the lost channel, and 12,600 cubic yards from the Grouse Creek channel. The average value was a shade under 36 cents per cubic yard. More than half the gold came from the Grouse Creek channel, which is therefore richer than the other. While the clean-up was in progress a slide of bed rock amounting to 3,000 cubic yards or more came down from the west rim of the east channel, covering a part of the uncleaned ground, so that not all the gold was recovered this year from the season's piping on that channel. One hundred and forty-four feet of the old sluice flume was rebuilt with new boxes at the end of the season.

METAL, ORE AND MINERAL MARKET.

Aluminium, No. 1 grade ingots—45 to 47 cents per lb.

Antimony—8 3-4 to 11 cents per lb.

Arsenic, white—7 cents per lb.

Barytes, crude—$18 to $20 per short ton.

Bismuth, metal—$1.75 per lb.

Cadmium, metal—$1.60 per lb.

Carbons for drills—$70 to $90 per carat.

Carborundum, powdered—8 cents per lb.

Chromium, metal pure—50 cents per lb.

Cobalt, f.o.b. Cobalt, Ont., unrefined—30 to 40 cents per lb.

Corundum—7 to 10 cents per lb.

Feldspar, ground—$10 per short ton.

Feldspar, lump—$8 to $13 per long ton.

Graphite, domestic—$50 to $150 per ton.

Gypsum, lump—$7 per short ton.

Infusorial earth, ground—$15 to $30 per ton.

Manganese, pure metal—75 cents per lb.

Mica, ground—$40 to $70 per short ton.

Mica, scrap—$10 to $15 per short ton.

Molybdenum, pure—$1.70 per lb.

Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.

Nickel, metal—45 cents per lb.

Platinum, ordinary metal—$26 to $26.50 per ounce.

Platinum, scrap—$19 per ounce.

Pyrite—10 to 11 3-4 cents per unit for 38 to 45 per cent. sulphur, lump ore or fines.

Quicksilver—$45 to $46 per 75 lb. flask.

Sulphur—$10 to $21 per long ton.

Talc—$15 to $30 per short ton, crude.

Tungsten, pure metal—$1.30 per lb.

Tungsten ore, 60 per cent. pure—$9.50 per unit.

MARKET NOTES.

Silver.—Nov. 7th, 59 3-8; Nov. 8th, 58 1-2; Nov. 9th, 68 1-8; Nov. 11th, 58 1-8; Nov. 12th, 58 3-4; Nov. 13th, 58 1-2; Nov. 14th, 58 1-4; Nov. 15th, 58 1-4; Nov. 16th, 58 1-2; Nov. 18th, 58 7-8; Nov. 19th, 59 1-2; Nov. 20th, 59 1-4. Mexican dollars, 47 cents. Sterling exchange, $4.860.

Copper.—New York, on November 20th, Lake, 13 1-4; electrolytic, 13; London, £58 3s. The market is still depressed. The financial depression is holding back buyers. Producers, on the other hand, do not wish to accept large orders at present prices.

Spelter.—Market quiet. There has been a heavy fall in prices. New York, 4.90 cents per lb.; London, £21.

Lead.—Market is continuing to weaken. New York, 4.30 cents; London, £16 17s. 6d. for Spanish.

Tin.—Market strong. New York, 31 cents; London, £135 15s. for spot.

Pig Iron.—At Pittsburg No. 2 foundry has fallen to $18.50, Bessemer $20.

Catalogues and Other Publications.

Merck's 1907 Index (third edition). An Encyclopedia for the Chemist, Pharmacist and Physician. Merck & Company, 15 University Place, New York. In this well bound, clearly printed volume are listed all of Muck's standard, rare and newest products. The Index is not a price list; but comparative values are indicated by a special code. Appended to the name of each substance is an abbreviated list of its physical and chemical properties.

The Westinghouse Machine Company's Catalogue P. is the first pamphlet we have seen devoted exclusively to storage batteries for portable service. The batteries are made for a wide range of service—for car lighting, for electric locomotive power, for auto trucks, and for any purpose in fact for which a storage battery is used. The prices of elements and of all accessories are plainly listed. Portable batteries vastly increase the utility of this form of energy. For certain varieties of mine work nothing could be more efficient than the modern, compact, efficient portable storage battery.

SOUVENIR HAND BOOK

OF

A.I.M.E. TOUR

THROUGH

COBALT, SUDBURY AND MOOSE MOUNTAIN

OWING to the extreme care necessary in handling the colour press work in printing this volume the publishers have been unable to bring it out as soon as was hoped. It is now ready.

Orders have been received for a large number. It is probable that a second edition will have to be printed. The publishers will consider it a favor if intending purchasers will send in their orders as promptly as possible. In this way the need of a second edition can be determined early.

FOR
ANY STORE

The right metal ceiling lessens fire-risk, beautifies any interior, is cleanly and lasts almost forever. Such a ceiling is easily put up, and costs no more than the common kinds. Learn the facts about

PEDLAR ART STEEL CEILINGS

More than 2,000 designs, suitable for every use. Side-walls in equal variety to match. Let us send you a book that tells the whole story of the ceiling that shows no seams. Address— 211

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the anadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

A. B. WILLMOTT, President and General Manager.

SAULT STE. MARIE, CANADA

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

Underwood

The Underwood Condensed Billing Typewriter describes itself in its title. An invoice (and as many carbon records as may be required) as well as the salesbook entry, are made at the one writing.

The salesbook entries are made on a long sheet, and are condensed, eliminating all waste space. Both sides of the sheet are utilized; disintegration columns may be added to the right of the total column upon the sales sheet, in which sales can be classified according to departments or ledgers.

We have an interesting catalogue which illustrates and fully explains this, and the other special Underwood bookkeeping machines. It is worth the trouble of asking for it.

United Typewriter Co., Limited, Adelaide St. East, Toronto
And in all the principal Cities.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

1,000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper .... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**

Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Sullivan Rock Drills

Sullivan "UF-2" (3¼-in. Rock Drill at work on a high face of ore in a Joplin "Sheet Ground" Mine.

In the Joplin Lead and Zinc District of South-Western Missouri

Sullivan Drills are extensively used under all conditions of service. The experience of a large number of operators, covering several years past, shows that Sullivan Drills have a greater drilling capacity, and cost less for maintenance, than any other drill used in the district.

This fact, of which there are many specific instances, is due to the simplicity of the Sullivan Drills, and to the excellence of their construction and component materials.

Mining work in the Joplin district is described in an especial article in the current

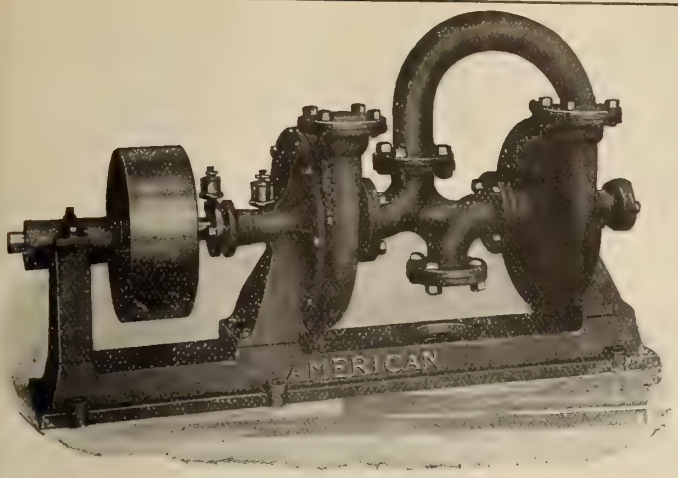
DRUMMOND COAL

The standard of excellence in Bituminous Coal and Coke for Blast Furnaces, Foundries, Manufacturing and Domestic Use. . . . .

RELIABLE, UNIFORM and STRICTLY HIGH GRADE



Shipped from Pictou Harbor, Halifax, and all points on Intercolonial Railway and connections by the

INTERCOLONIAL COAL MINING CO.
LIMITED

WORKS, WESTVILLE, N.S., - James Floyd, Sup't.

HEAD OFFICE, MONTREAL, QUE.

JAS. P. CLEGHORN, President. D. FORBES ANGUS, Vice-Pres. and Man. Director.

We manufacture the "AMERICAN" Centrifugal Pumps. These are built in three styles.

Single Stage Horizontal or Vertical up to and including total lifts of 65 ft.

Single Stage High Pressure horizontal for lifts up to and including 125 ft.

Two Stage High Pressure horizontal for total lifts up to and including 250 ft.

We guarantee at least 25% mechanical efficiency over any other pump of equal size or make, or we can furnish 25% more water with same size of pumps and power than can be procured with any other make of centrifugal pump.

Give us your specifications and we will make you our best prices.

R. H. Buchanan & Co., Montreal, carry our pumps in stock.

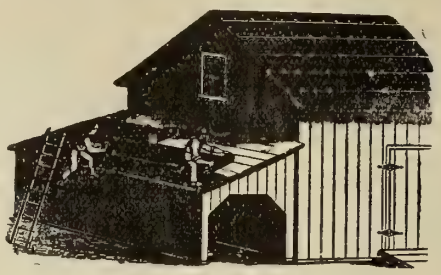
Amatite ROOFING

The Mineral Surfaced Roofing

Ordinary ready roofing is made with a smooth surface, prepared to receive a coat of paint. Sometimes the paint is applied at the factory and when the roof is laid no coating is required, but after a year or two the paint, under the hard conditions of roof service, wears out and it is necessary to coat the roofing again. Every year or two after that the same thing is necessary, and the expence of these annual paintings will in the end be more than the original cost of the roofing.

Amatite, however, is a different kind of roofing. In place of the smooth surface it has, on the weather side, a firmly embedded layer of crushed mineral matter. This mineral matter will wear longer than a dozen coats of paint. It needs no coating, and when your Amatite roof is once laid the work is all done and the expense is ended.



The durability of Amatite is assured by its thickness and weight. It contains more material per square foot than other roofings costing several times as much.

Booklet and sample will be gladly sent to you without charge, if you will forward your request to the nearest office.

THE NEW DIRECTOR.

The appointment of Professor Reginald W. Brock to the position of Acting Deputy Minister and Director of the Geological Survey of Canada has been announced.

Referring, in a recent editorial, to the manner of man needed for this dignified and responsible office and to the Survey's need of reorganization, we stated that the new Director should be young, energetic, fearless and entirely free from political strings.

It is with sincere pleasure, then, that we congratulate the new Acting Deputy Minister and Director upon his appointment, and the Minister of Mines upon his choice.

Mr. Brock is young. His academic career, although undeniably brilliant, may also be more adequately described as one of exceptionally solid attainment.

As a field geologist Mr. Brock has stood almost pre-eminent among the geologists of Canada in at least one most important respect. In his work, more especially in British Columbia, he has subordinated the academic to the economic.

This very consideration, along with a knowledge of Mr. Brock's academic and professional successes, was doubtless the deciding factor in the Government's choice.

The Department of Mines and Canadian Geological Survey do not require a savant as their head. Neither do they need a specialist. Either variety of man would prove a hindrance.

What the Department and the Survey need (and in Mr. Brock this need we believe is filled) is a virile young Canadian, who knows Canada's needs at first hand.

The work of the Geological Survey cannot be delegated to others. The Survey's traditions, its honorable record in the face of meagre appropriations and political strife, are dear to every Canadian. It is to be hoped that the new Director will be supported, not only by the officers of the Survey as a whole, but by all the mining men of Canada.

To a very large extent the growth and advancement of Canada's mineral industries depend upon the intelligent activities of the Geological Survey. The Survey will be of incalculable benefit to the country if, from the first, obstacles are cleared away from the Director's path and if he is strengthened by a clear knowledge of the fact that the mining fraternity is solidly for him.

SMELTER SMOKE.

On another page we reprint from our valued contemporary, the *Mining and Scientific Press*, an article on smelter smoke. In view of the proposed establishment of a smelter for treating the arsenic ores of the Cobalt

and other districts, and the probable erection of a large iron smelter within a very short distance of Toronto's business section, this article should be read with care.

Attention is particularly directed to the fact that many complaints received by the authorities in smelting districts of the United States are exaggerated or even baseless.

Like the accident artist who makes the street railway pay damages on pre-arranged accidents, the farmers of the Western States have persistently presecuted the smelters.

If Toronto is to encourage the growth of metallurgical establishments within her limits she must take care not to be misled by the hypersensitive nostrils of sensation mongers.

At Deloro hardly a trace of arsenic is lost. Although many thousands of tons of highly arsenical ores have been treated there, no damage whatever has been done to the surrounding country.

STUDENT AUTONOMY.

For long Queen's University has encouraged her students to take in their own hands the enforcement of discipline. The students of each faculty have their own particular tribunal. The Arts "Concursus" and the Science "Vigilance Committee" are swift to punish error, pride, and disrespect in fellow-students. From the decisions of these courts there is no appeal. Sentences are carried out with speed and precision. Consequently there is seldom any need of interference on the part of the professors.

Following the admirable example of Queen's, the University of Toronto is making the undergraduates responsible for the preservation of law and order through committees chosen by the students themselves. This is discreet. Self-government induces self-respect. Self-respect inhibits acts of vandalism.

SCHOOL READERS.

To Mr. J. B. Tyrrell's article on "School Readers" we have given a prominent position in this issue of THE CANADIAN MINING JOURNAL.

With crisp directness Mr. Tyrrell indicates the vital need of teaching our children something about an industry which is of paramount importance to Canadians.

No argument is needed to support the dictum that a knowledge of the history and value of Canadian mines and minerals would be of infinitely greater value to the rising generations, than much of the meretricious, sentimental "literature" that is now considered essential to a child's education.

Undoubtedly no sounder, truer foundation for citizenship could be laid than by imparting to school children a definite conception of the story of Canada's mining industry.

Mr. Tyrrell refers to the history of Silver Islet. For sheer romance and engrossing interest Silver Islet's story can hardly be paralleled. And yet, we suppose, not one child in a thousand knows that there ever was a mine on Silver Islet.

Take, as other illustrations, the discovery of Copper Cliff, the finding of Cobalt, the checkered history of the Lake of the Woods, the early rush for gold in Nova Scotia, the struggles of the iron industry in Ontario and Nova Scotia, the drama of gold, silver, lead and zinc in British Columbia, the discovery of gold in the Yukon—is not any one of these subjects pregnant with inspiration for the youth of our land?

We need not look into the dim past for heroes. There has been, and there is now, more quiet heroism in the pioneer and prospector, in the working miner and in the mine manager, than in all the bold, bad barons of the middle ages.

Mr. Tyrrell's paper is more than timely—it is of very deep significance. Indirectly mining men themselves have something to learn from it. Between the lines they may gather that now, as always, the claims and duties of citizenship are as binding upon the mining fraternity as upon any other class of men.

A GOOD REPORT.

The annual report of the directors of the Consolidated Mining & Smelting Company of Canada was noticed briefly in our last issue. The report is, however, worthy of more detailed attention. A cursory glance through the attractive pamphlet is edifying.

For the year ending June 30th, 1907, the Centre Star and Ware Eagle group produced 81,788 tons of ore, yielding 32,306 ounces gold, 27,808 ounces of silver, and 1,030,529 pounds of copper. The total value of these metals was $893,239. The corresponding figures for the St. Eugene mine were: 127,645 tons of ore, 24,737 tons of concentrates, yielding 675,959 ounces of silver and 29,391,389 pounds of lead, valued at $1,713,933. The Snowshoe produced 49,002 tons of ore, 2,989 ounces of gold, 16,171 ounces of silver, 1,372,056 pounds of copper, a total value in metals of $397,141.

At the Trail smelter 222,573 tons of ore were smelted, yielding a total value in metals recovered of $3,786,146.

Resolving these figures into averages, we find that the Centre Star and War Eagle are averaged $10.92; the St. Eugene ore, $13.43; the Snowshoe ore, $8.10. The ore smelted at Trail averager $17.01.

Since March, 1898, the Trail smelter has produced metals the gross value of which is estimated at $25,800,231.

In the Centre Star and War Eagle group there are about sixteen miles of underground work and about ten miles in the St. Eugene. A large total of underground development and of diamond drilling was performed during the year.

Nearly half a million dollars were expended in new construction and improvements.

To guarantee an adequate supply of lead ore for the Trail smelter the Consolidated has entered into an agreement with the Canadian Metal Company, whereby it secures the Canadian Metal Company's entire output of lead and zinc concentrates for a period of years. The Consolidated Company has a strong hold upon the Canadian, Chinese and Japanese lead markets. Hence this step was necessary.

The report is signed by W. H. Aldridge, managing director. It concludes with a warm recognition of the valuable services of several of the company's officers. To Mr. R. H. Stewart, mine manager, is attributed the excellent condition of the company's mines.

Messrs. Jules Labarthe, T. W. Bingay, William Chambers, John F. Miller, A. J. McNab, all of whom are officials connected with the Trail smelter, are given especial credit. Mr. R. Purcell, Mr. W. P. White, Mr. Charles Biesel and Mr. John M. Turnbull, who are responsible for various individual mines, are placed in the same roll of honor.

Such open recognition of faithful services, coming from a superior officer, is evidence of harmony and cooperation among the various members of the staff.

THE VALUE OF CORRESPONDENCE INSTRUCTION TO THE MINING MAN.

This is the title of a paper read by Mr. H. H. Stoek, editor of *Mines and Minerals,* before the American Mining Congress at its annual meeting in Joplin, Missouri.

Mr. Stoek traces the history of the International Correspondence Schools. The story of the origin and phenomenal growth of this institution is one of absorbing interest. The actual beginning of mining instruction was made about 1885 by Mr. T. J. Foster, who started a series of technical articles in the *Mining Herald,* published in Shenandoah, Pa. These articles "were intended to assist the ambition and studious men about the mines."

From this small beginning has resulted a system through which 34,496 persons have received mining instruction.

The success of this important movement is justly attributed to the actual need of just such simple, flexible and practical educational method and to liberal "inspirational" advertising.

By means of carefully compiled statistics, Mr. Stoek demonstrates that in general the correspondence student makes a more energetic and successful miner than the miner who relies upon his unaided intelligence. The fact is accentuated that no man can learn by correspondence unless he is willing to make sacrifices of his spare time, and that this very willingness argues the presence of more than average backbone.

Many mining engineers, graduates of technical colleges, pay for a correspondence course for the sole purpose of securing a set of the International text-books. Others again, after leaving college, take the correspondence course as a supplementary training.

Reading Mr. Stoek's clear and forceful paper impresses one with two things. Firstly, the International Correspondence Schools have done a vast amount of good. They have opened the way to promotion for hundreds of men to whom the doors of our colleges are closed. They have imparted the right kind of instruction in the best available way to the men who most needed it. For these men, workmen, foremen, and bosses, our Canadian educational systems have made little or no provision. Only in Nova Scotia is a serious attempt being made to meet the requirements of these classes. Hence, both in Canada and the United States the correspondence system has performed a function of extreme importance.

But, excellent as is the system of the International in conception and in administration, efficient and complete as are its courses, it is obvious that its very existence is due to a vital defect in our present educational conditions. The absence of any provision in our schools and colleges for means to do the work that is done by the correspondence schools is anomalous and anachronous. We are not over-stating the claims of what, for lack of a better name, we designate the laboring classes, when we say that in all large communities they are and must be paramount. These claims our educationists have so far neglected to consider, and the correspondence schools have filled the gap.

The correspondance schools, of which the International is by far the largest and most important, have been created to supplement present educational systems. In this sense they are an artificial growth. To Canada their existance means a loss in money; but, also, a more than compensating gain in the increased efficiency of student-workmen.

It has often been pointed out that this money should be kept in Canada. This, however, is not the point. The benefits conferred by the International Correspondence Schools alone are worth more than can be expressed in terms of money.

The real question is this—must we not, as Canadians, see to it that to every man is given at all times the opportunity of securing exactly the kind of education he needs? It is not necessary to disparage the correspondence schools. It will, rather, be necessary to emulate them.

A ROYAL COMMISSION NEEEED.

The Toronto Branch of the Canadian Mining Institute has formally requested the Ontario Government to appoint a Royal Commission "for the purpose of revising, simplifying and amending the 'Mines Act' and the 'Act to Supplement the Revenues of the Crown.'"

The memorial suggests that at least one-half of the members of the Commission be chosen from the ranks of Ontario branches of the Canadian Mining Institute.

This course has been recommended after mature deliberation. It is confidently expected that every mining man in Ontario will support the movement.

It has been found impossible to obtain, through local meetings, any set of recommendations that would meet the whole situation. Special interests crop up, grievances are aired, and only one or two phases of the problem are discussed. So complicated are the questions of mining legislation and special taxation that the closest attention of a picked group of specialists for a considerable period will be required before comprehensive and constructive revision can be possible.

We endorse most heartily the request of the Toronto Branch.

It is unnecessary to dilate upon the large and urgent problems awaiting the attention of the Royal Commission. But we may reiterate our belief that the need of such a Commission is indisputable.

NOVA SCOTIA'S IRON ORES.

The annual report of the Department of the Interior includes the report of the Superintendent of Mines, the preliminary reports of Dr. J. E. Woodman, Mr. F. Hille, and Mr. Fritz Cirkel, on the iron ore deposits of Nova Scotia, Western Ontario and the Ottawa Valley, respectively.

Dr. Woodman advocates the payment of a cash bonus direct to the operators of small iron ore deposits. The necessity of this, as a stimulant to development, is particularly noticeable in Nova Scotia. The present system of bounties enriches the stockholders of iron and steel companies and has very little effect upon the operators of mines.

Referring to the Torbrook-Nictaux basin, Dr. Woodman characterizes this district as the most promising iron field in Nova Scotia. The country is open, a substantial water power at Nictaux Falls awaits utilization, transportation is easy, and within a few miles an abundance of hardwood timber is available.

The "basin" is described as either a large syncline or a succession of smaller folds, the axes of which run approximately north 55 degrees east to north 60 degrees east. The ore is interstratified, having replaced limestone beds. The basin's limits are vague, and have not yet been clearly defined. But many square miles have been explored already. The Annapolis Iron Company, controlled by the same interests that operate the Londonderry furnace, owns these ore deposits and ships ore to Londonderry. High grade hematites and siliceous magnetites are found in large quantities. All of the ore is phosphatic and most of it carries from two to eight per cent. of lime.

After touching upon the Clementsvale, North Mountain, Brookfield and Cobequid districts, Dr. Woodman takes up the Arisaig deposits of Antigonish County. As now known the Arisaig ores run east and west for a distance of five and one-half miles.

The Arisaig bedded hematites occur in nearly vertical veins and, so far as known, as continuous for a great length on the strike. Vertical sections of the highest and lowest exposures give a depth of 350 feet. No drilling has been done to prove the deposits to greater depth. In the western part of the field the ore is less silicious and freer from trap intrusions. All of the ore, Dr. Woodman states, averages under fifty per cent. metallic iron in car load lots. Water power of not inconsiderable magnitude is available.

Dr. Woodman demonstrates the need of careful investigation of the whole Arisaig field.

To the reports of Messrs. Hille and Cirkel we shall refer later.

COBALT RESPONDS.

As has been expected, Cobalt has responded to the call upon her energies. November's output exceeded by more than one hundred per cent. that of any previous month. Shipments amounted to twenty-five hundred tons. Comparing this with previous figures, it becomes apparent that Cobalt is but beginning her career as a producer. But even these figures are not to be taken as indicating Cobalt's entire output. Several of the richer mines are holding several car loads each of high grade ore and concentrates. Altogether there are at least thirty cars of this high grade material being held in stock on account of difficulties with the smelters. Thus, although Cobalt is doing well, there is sound reason to believe that unexpectedly greater shipments will be begun and continued throughout the coming year.

Several special agents of English, German and French smelters have visited Canada recently. We believe that the principals whom these gentlemen represent are prepared to take advantage of the present friction between American buyers and Canadian shippers of ore. But (and this is most significant) the trend of inquiry is markedly for ores containing high percentages of cobalt. It will not, therefore, be surprising if a wider market develop within the very near future. As pointed out before, this will mean renewed activity in Portage Bay and like districts.

WISDOM.

The Rossland Miners' Union, fully appreciating the difficulties under which mine operators are now struggling, very wisely consented to a reduction in wages. The only possible alternative was a shut-down.

The Rossland mines were closed down for a day to give the miners of both shifts an opportunity of meeting inw discussing the proposed reduction of wages. The referendum vote favored the resolution by a two-thirds majority.

It is gratifying to observe the calm, judicial attitude of the workmen in this conjuncture. This is a practical manifestation of the spirit of mutual helpfulness.

OFFICIAL PUBLICATIONS ONCE AGAIN.

The Canadian Mining Journal recently drew attention to the fact that the usefulness of the Provincial mining reports was considerably lessened by delay in issuing them. This serious drawback from the standpoint of those in search of recent information as to mining development has been noted by others. Mr. Harrison Watson, Canadian representative of the City Trade branch of the High Commissioner's office, London, reports as follows to the Department of Trade and Commerce:—

> "We continue to receive a considerable number of inquiries about Canadian mineral resources, and applications for copies of the reports on mining operations, which are annually issued by several of the Provinces. In this connection several persons have called attention to the apparent delay which occurs in the publication of these reports, whereby much of the news is to a certain extent out of date by the time the particular report is in the hands of the public. There are naturallly difficulties in compiling reports of this description where the material comes from so many sources, but on the other hand it is possible that some improvement might be made in the direction indicated."

Now that a widespread interest in Canadian mineral resources has been awakened in Britain, it is specially important that up-to-date official information should be accessible. So far as the reports of the Ontario Department of Mines are concerned, the difficulty might be overcome by making them considerably less voluminous. In addition to the report proper, dealing with the output and conditions of working mines, a number of special papers and exploration reports are included in the document. The latter, largely of a scientific character and of less timely interest, had far better be omitted and published subsequently in separate form, rather than be the cause of delaying for months the appearance of the practical data regarding actual mining operations which ought to be furnished as promptly as possible in order to be of value.

Editorial Note.

A report from Harrison Watson, of the Canadian High Commissioner's office, London, states that the chemist of one of the largest British manufacturers of grate polish and black-lead, who is proceeding to Corea to examine some plumbago deposits, was furnished with information at the High Commissioner's office concerning Canadian plumbago and his attention drawn to specimens shown at the Imperial Institute. He proposes to visit Canada before returning to England, being of opinion that some the Canadian plumbago would answer the purposes of his company.

A TIMELY WARNING.

F. W. Gray.

The folowing is quoted from an Associated Press Despatch of the 4th of December, descriptive of the conditions prevailing after the recent disastrous explosion of firedamp in the Namoi Mine, of the United Coal Company, near Fayette City, Pennsylvania. "The physicians present have been in almost constant requisition on behalf of the rescuers, who, despite the fact that they work in relays, only a fraction of an hour, are constantly being prostrated by the fumes of gas."

If the information given by the American Associated Press is correct, it discloses a lamentable lack of knowledge in the Pennsylvania coalfield, of the modern breathing apparatus designed for just such cases as the Naomi Mine disaster. We believe it is a fact, that the only breathing apparatus of the modern type in the United States, was that exhibited in a recent exhibition of a Life Saving Society in New York. The United States Government recently detailed an expert to inspect the various Recue Stations on the continent of Europe with a view to having something similar in the coal regions of the States, but so far as we are aware no such provision has as yet been made. It is distressing to hear of men losing their lives, and of brave rescuers toiling in unavailing effort amidst deadly gases, when we know that devices are to be acquired, which would enable these heroic workers to render real assistance to their fellows at practically no risk to themselves. In the old days the death roll of an explosion was more often, than not, augmented by the death of would-be rescuers overcome by the post explosion gases, but to-day with perfected devices such as are used in every colliery district in Europe, there is no need for such a task on the physical powers of rescuers. In this respect the United States is behind even Russia and Spain, in both of which countries, properly equipped Rescue Stations operated by trained gangs of workmen, are made compulsory by the laws of the country. One of the apparatus we have referred to has up to date, the total of 50 lives to its credit, the lives of men who would otherwise have been poisoned by afterdamp. It is strange that the United States should lag behind second-rate European countries in this matter, that the country which boasts of the largest coal output in the World, should care so little about the lives of its miners. Such apathy cannot be from lack of knowledge. It is that the coal operators of America are afraid of humanitarianism or of expending money on apparatus, which do not directly help to pay dividends? There is another side to this matter, however, for the greatest usefulness of the breathing apparatus, we think will be found in that it enables men to extinguish mine fires in their first stages, and for this reason is a sound investment as fire insurance. Many a mine fire that has cost the operators thousands of dollars, could have been extinguished had properly trained men equipped with modern breathing apparatus been ready to respond to the alarm, as they are in Germany, France, Belgium, Austria, Russia, Spain and Britain. The whole subject of rescue work after mine fires and explosions is one that is deserving of the earnest attention of every coal operator. The Courrières disaster compelled public attention to this matter in Europe. If ever such an appalling disaster should visit the States, they will be found very unready in the work of rescue, if we have interpreted the despatch correctly that we first quoted.

THE ACTING DEPUTY-MINISTER OF MINES OF CANADA.

The official announcement that Mr. Reginald W. Brock, Professor of Geology in the School of Mining, Queen's University, Kingston, had been appointed Acting Deputy Minister of Mines and Director of the Geological Survey of Canada has met with the warm approval of all mining men.

Especially in the Provinces of British Columbia and Ontario, where Mr. Brock has done his principal work and where, consequently, he is best known, will the news be most welcome. As a trained mining geologist Mr. Brock has been most successful. In fact he ranks among the most brilliant and substantial of North American practical, economic geologists. Mr. Brock, whose father was a Methodist minister, entered the University of Toronto in 1890. During the summer of 1891, and for several succeeding seasons, he acted as field assistant in Geological Survey parties. In 1893 he left Toronto University and entered upon a course of study in the newly organized School of Mining in Kingston. Graduating in 1895 with high honors in science, he proceeded to Germany. Here for the summer of that year he studied at the University of Heidelburg. His instructors in geology and mineralogy were the famous professors Rosenbusch and Goldschmidt. The following autumn he returned to Kingston to assume the duties of Acting Professor of Mineralogy, Professor Nicol being absent on leave in Europe.

During his course in Toronto Mr. Brock had the advantage of some newspaper training. This experience, valuable to any young man, was of great benefit to Mr. Brock. The effect is easily perceptible in the more than ordinary ease and clearness of his reports.

From 1896 to 1900, inclusive, Mr. Brock was engaged as a permanent officer of the Geological Survey staff. Throughout this period his principal work consisted in developing the mining geology of British Columbia. His brilliant reports upon various mining districts at once won him recognition, and he was soon acknowledged to be one of the leading economic geologists of the day.

It is seldom indeed that recognition comes so unreservedly and so rapidly. But the practical value of Mr. Brock's carefully conducted field work appealed immediately to the mining men of the Dominion.

After spending another year in Heidelberg, Mr. Brock became Professor of Geology in the School of Mining at Queen's in 1902. Since that time Mr. Brock has spent his summers in the field work of the Geological Survey. Most of his work consisted in a detailed examination of the Rossland mining district. At the request of the mining companies themselves he reported upon Le Roi, War Eagle, Centre Star and other Rossland mines. It is this important work that has done more than anything else to establish Mr. Brock's reputation.

The most efficient Geological Survey in the world is that of the United States. The recently appointed Director, Dr. George Otis Smith, is a man of about the same age as Mr. Brock. But it may be doubted if his training and experience have been as complete as those of the new Canadian Director.

Geology as a branch of academic speculation is one thing. Mining geology is a quite different thing. Of the former Canada has had enough. Of the latter all mining men fully appreciate the necessity.

Excellently as the new Acting Deputy Minister and Director is equipped for office, he will not be able to work to best advantage unless he has the outspoken, constant and hearty co-operation of all those interested in the honest, rapid development of Canada's mineral wealth.

SCHOOL READERS.

Probably within a short time the Government of Ontario will revise its readers in use in the public schools, or possibly it may prepare a new set of readers altogether. In either event nothing could be more appropriate than that a goodly number of articles should be included in them descriptive of the mines and mineral industries of Canada, with accounts of their discoveries, growth and progress up to their present condition.

An account of the discovery of nickel at Sudbury and the development of the nickel industry up to its present enormous proportions would make a most interesting and instructive story, while the history of Silver Islet should be known to every child in the Province. Relations of incidents in the lives of prospectors who have travelled in canoes, and on foot with packs on their backs, through the northern forest would be far more entertaining to children than the trivial and mendacious stories of travel and adventure which are now current among the people, and especially among the children.

The value of a large part of Canada must ultimately depend not on its agriculture, fisheries or forest resources, but on its production of mineral wealth; so that mining is and must always be in increasing measure an industry of the first importance to us.

In no way can the people of the country be educated to appreciate the importance of the mining industry better than by informing them of it from their very earliest years through the medium of the school readers. The children might then grow up ambitious to emulate the exploits of some of our most successful prospectors, who have travelled through the wilderness with the constant aim of finding valuable deposits of ore, instead of having their thoughts foolishly centred on bears and wolves with the loveable attributes of the theatrical villain and the appearance of the woolly denizens of the toy shops.

Accurate information about our own mines and mining possibilities and about the hazards of the search for ore, so imparted to the children through the school readers, would form a basis for a sound knowledge of Canadian mining conditions, and of the vast importance of the mining industry to the general progress and welfare of the Dominion, and at the same time would fortify them against the blandishments of the men who endeavor to get their money on the fraudulent pretext that they are investing it for them in mining enterprises.

I trust that not only Ontario, but all the other Provinces in the Dominion, will see to it that the children are taught something about the mines and mining possibilities of Canada, and to that end will incorporate in their school readers, interesting and accurate accounts of their mines and mineral deposits.

J. B. Tyrrell,

9 Toronto street, Toronto, Ont.

UNDERGROUND HAULAGE.

Paper read before British Society of Mining Students.

(*Continued from last issue.*)

Advantages of its use.—The advantages of endless rope, where it can be adopted, are as follows:—

Instead of being worked intermittently, all sections of the mine are sending coal to the shaft at the same time, therefore a constant supply is always being received at the shaft by the onsetters.

No mishap in one district will affect the others, as the clutch gear of the former can be thrown out of action and its rope stopped until the needful work of repair is completed.

No large shaft sidings or inbye landings are required.

Where the road is undulating, the tubs on the dipping gradients help the engine to pull up others on the ascending gradients.

A smaller engine will do the work. It is driven at a constant slow speed, and being fitted with a governor, the speed is kept constant, and it can be made very efficient and economical in the working.

Where few or no coals are coming out of one district, its rope can be thrown out of action, thus easing the work of the engine.

There is no large wear and tear of rolling stock, as accidents from derailed tubs are not so serious, and rarely happen except on heavy gradients.

All sections of the pit are continually supplied with tubs as required.

The engine can be erected on the surface, the band ropes being taken down the shaft and there connected to the main haulage wheels, which are driven by friction clutch gearing.

The engine being in daylight can be better examined and cleaned.

Where haulage roads have to be close-timbered it sometimes is advisable to put in endless rope, because there is less liability for slow-travelling tubs to be derailed, thereby knocking out the props and wrecking the place, than would be the case with the high-speed running of main and tail.

Position of Rope.—There are three particular ways for attaching the tubs to the haulage rope, viz., (1) over the tubs, (2) under the tubs, and (3) at one side of the tubs. One of the first two methods is generally adopted. The last is chiefly used for a certain method, to be referred to later on.

Over Tub Method of Attachment.—This method is applicable where the road is level or has only slight undulations, and is either straight or is curved along some sections. The carrying capacity of the tubs should not exceed 10 hundredweight, and are best not filled much above the level of their sides. The overhead system can in most cases be satisfactorily used, but not in cases where the tubs run on a narrow wheel gauge, or where the wheels are coupled close together, as under either of these conditions there is a great risk of the tubs leaving the rails. The tubs are mostly run singly or in pairs, or in threes; two clips are generally used in the last case, one at each end of the set. The sets or single tubs are kept at regular distances apart, being comparatively close if there are few or no branch roads throughout the course of the main haulage road, and from 10 to 20 yards apart where these branch roads occur frequently, as that interval allows the lads who are stationed at the branch roads ample time to switch the tubs required into their particular districts before the next set reaches them. Light clips are best adapted for this method. Two forms of these, one known as *The Elswick Haulage Clip,* and the other locally known as *Jockeys,* are especially suitable for over attachment of the tubs.

Under the Tub Method of Attachment.—On haulage roads having steep inclinations, or even slight ones, if tubs are loaded with more than 10 hundredweight of coal, more especially where tubs are filled above the sides or where curves or undulations are of frequent occurrence, the under-rope method of haulage is the best to adopt. The underneath rope is better gripped, thus forming a more secure attachment for the tubs. During their transport they are not likely to tilt or leave the rails in passing along the curves. There is less liability for coals to be knocked off the tubs and strewn about the roadway.

Several forms of clip are suitable for this system, such as *Smallman's,* which is much used, also *Middleton's, Fisher's,* and those attached to bogeys run with the sets of tubs.

Clips.—One of the chief things to ensure a successful working of the endless rope haulage is the use of well-chosen forms of clip, as upon these as much as upon anything else must we depend upon getting the tubs carried securely along with a minimum of friction. Any particular form of those on the market will not suit every method of haulage. One may sometimes be best adapted for under-rope attachment, and another for overhead attachment, whilst different makes from either of them may act well on level roads and light gradients, and be an absolute failure on haulage roads having greater inclinations. Some are adapted for hauling one or two tubs at a time, whilst a different and much stronger form is necessary for sets of six, eight, or more tubs. Fortunately we have a varied selection of clips to choose from, and a careful consideration of the conditions of the work we have in view for them must determine the selection of that most suitable for a specific purpose. Where tubs are run separately, in twos, or in threes, a larger number of clips for the whole length of a long engine plane are required of the adapted form. Owing to the necessity for the frequent fixing and detachment of the clips they must be made light and handy, so as to facilitate these operations, and, where practicable, be adapted for use in conjunction with an automatic contrivance for their release from the tubs at curves, landings, and shaft sidings. Stronger clips are necessary for heavy work, or where sets are composed of large numbers of tubs. In such cases the total number of clips required is less for a given output than in the cases of shorter sets or single tubs. Those for attachment to the overhead rope are generally automatically released, but rarely is any device available for automatic release with the under-rope methods of attachment. Whilst where the sets are composed of six, eight, or more tubs, a very strong clip having a vice-like grip, worked with a hand-wheel, is preferable; those of lighter form are tightened by means of a hand lever. Clips may be said to consist of four varieties, viz., forks, lever clips, screw clips and bogey clips. Each variety again is subject to alteration in its construction so as to make it suitable for special work.

Forks.—These in the North of England are known by the names of jockeys, and are used only for over-rope haulage (*See Fig. 8*). One of the simplest and most effective is that shown in the sketch. The stalk fits into a socket formed by two holes a few inches apart, vertically made in the iron hoops at the middle of the two ends of the tub. The projecting plate at its upper extremity has a narrow notch formed in it; in this notch the haulage rope rests, its weight pressing downward sufficiently to grip and carry forward the tub when the rope is in motion. In the case of a heavily loaded tub the pockey is slightly twisted in the socket so as to give the rope a firmer grip. These forks are not trustworthy on roads with steep gradients.

Automatic Release of Jockey.—This is effected by the raising of the rope to such a height as will ensure its leaving the jockey. Ordinarily the overhead rope is prevented from touching the floor of the engine plane by the spacing of the tubs, which are never so far apart as to allow of the rope resting in the jockeys swagging much between. Fig. 9 shows a device which causes the rope to leave the tubs at desired positions. C and D are two vertical supports placed 6 feet apart, the upper portions of which are securely bolted to the roof timbers A and B. The support C is divided at the lower extremity sufficiently to take the small pulley F, and its length is such as to just allow of the rope, in contact with the lowest part of its circumference, resting in the

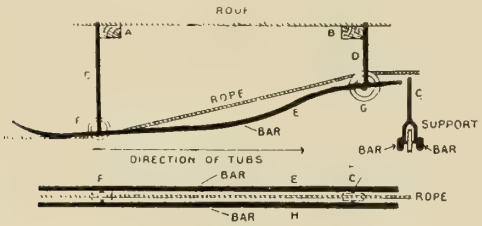

Fig. 9.

UTOMATIC KNOCK-OFF FOR JOCKEY. ENDLESS OVERHEAD ROPE

jockey. The support D is divided at its lower extremity sufficiently to take the small pulley G, and is much shorter than the support C, and the rope rests upon the highest part of its circumference. The supports C and D are connected at their lower extremities by a pair of bars E, H, which bars are spaced two inches apart and bent, as shown in the sketch. The tubs, travelling in the direction of the arrow, on reaching the pulley F continue their further course owing to a descending gradient given to the road, assisted by the impetus of their travel, and the rope, owing to its ascent over the pulley G, is constrained to leave the jockey in which it previously rested.

The Elswick Clip (*Finney's* Patent), shown in Fig. 10.—This is another clip most suitable for over-rope haulage, especially on heavy and undulating roads. It is stronger than the jockey and has a much tighter grip of the rope, a hand-lever on the top acting on a screw-plane to securely fix its jaws round the rope. The stem or stalk of the clip fits a socket formed of two loops or holes similar to that of the jockey; a lug or gib is cast on the stem projecting from one side. As it is inserted in the socket it is given a quarter of a turn round, and in this position the lug catches under the top hoop and cannot return therefrom until it is turned gack again. A knock-off bar, fixed at any required point in the road, comes in contact with the lever at its upper extremity, which is thereby depressed from its vertical position, causing the jaws to open and the rope to be released. These clips are also made with a hook on the top of the stem instead of the gib for fixing over the end of the tub, the lower part sliding into the yoke-hole. As thus

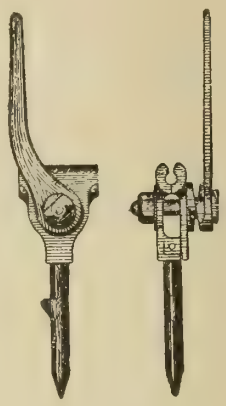

Fig. 10.

THE ELSWICK CLIP.

made the clip is very convenient in use upon level roads, but for all roads with gradients the form having the gib on it is best.

Smallman's Clip.—This clip is often used for under-rope haulage, especially on steep and variable roads. It consists of two plates, loosely connected by a centre bolt. Two jaws at its lower extremity are worked by a hand lever placed at one end to securely grip or release the rope as required, the centre bolt being adjustable to regulate the amount of slackening and closing at the jaws. Either a hook or a link, according to requirement,

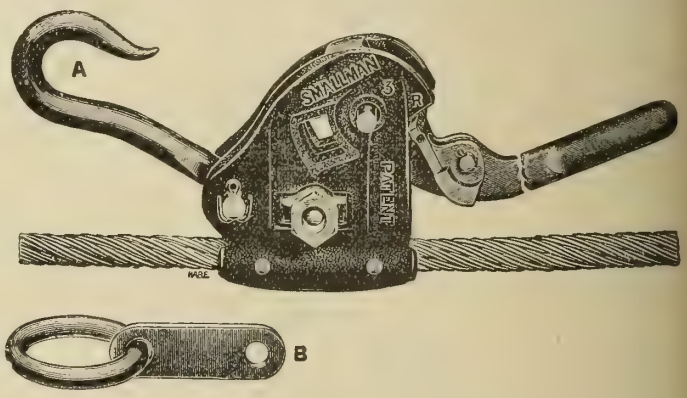

Fig. 11.

SMALLMAN'S CLIP.

Fig. 12.

AUTOMATIC DETACHMENT FOR SMALLMAN'S CLIP. UNDER-ROPE.

is attached to the end of the clip, opposite the lever, for attachment to the tub. This clip can be automatically released from the rope where required. For this purpose a detacher is bolted to a sleeper between the rails. The upper surface of the detacher is curved and fixed at

such a height above the floor as causes the lever of the advancing clip to come into contact and slide over it. The lever is bent, and in continuing its course over the detacher, it is uplifted sufficiently to open the jaws, bringing about the release of the rope, the tub then under the influence of gravity, continues in motion, with the clip attached, to a point upon reaching which it is taken off the tub. Fig. 11 shows this clip, and Fig. 12 the detacher.

Bogey Clips.—These clips are admirably adapted for use on steep haulage roads, or on those where a large number of tubs are run together in sets. The clip

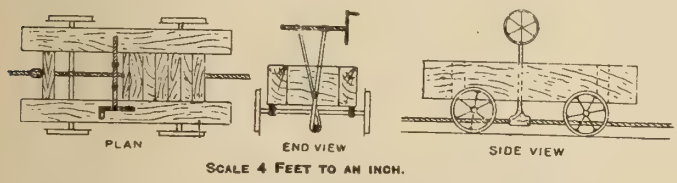

Fig. 13.

BOGEY CLIP.

proper consists of a pair of wrought-iron bars, working scissor-like on a pivot, the lower ends or jaws of which grip the rope when tightened by a right and left hand screw, worked by a small vertically-placed wheed. This clip is fitted to a heavy bogey wherein a lad sits during the runs. (*See Fig. 13.*)

The tubs run in sets of 20 and upwards, larger numbers than 20 at a time requiring a bogey at each end. On approaching branch roads, the rope is released by the run-rider until the switches are turned to direct the set aright, the journey then being resumed, and the sets run in or out, to or from, their respective districts, the rope being gripped again when the set has gravitated round or past the curve. These bogey clips are very strong and rarely get out of order.

Screw Clips.—These are fastened on to the ends of the tubs. They consist of two vertical bars of wrought-iron, fitted with collars near their extremities. A small horizontal projecting bar, bent downwards at the end, is welded on the top of collar. The bent portion can be placed in the yoke-hole of the tub; a bolt and shackle are attached to the lower collar, and form a means of connection, to the tub chains. The longer bar is formed with a foot shaped to receive the rope, which is gripped between the two bars when the shorter, by means of a hand screw at the top, is tightened upon it. The rope

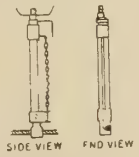

Fig. 14.

SCREW CLIP.

is thus securely seized in the grooved jaws. When this clip is used, sets of three or of six tubs are generally coupled together. Fig. 14 is an illustration of the screw clip.

Curves for Endless Rope.—Curves are rather difficult to lay out for this method of haulage, and require constant attendance, especially for an overhead rope. The sets of tubs run on the inside track of rails along the curve, the other sets of tubs moving in the contrary direction on the outer track of rails are automatically released on reaching the curve, and continue their course to the end of the curve under the influence of gravity, the floor being suitably inclined to ensure this. Upon reaching the end of the curve the sets of tubs are again clipped to the rope. Fig. 15 shows this arrangement.

The curve proper for over-rope is made by building a brick wall along one side from the floor to a height, equal to that of the tubs throughout the extent of the curve. On the top of this wall rollers from 6 to 9 inches wide fixed in iron frames are placed 3 fet apart; they revolve horizontally and project beyond the brickwork to the centre of the rail track. The clips and the rope being above the tubs glide along these rollers all the way round the curve. The top flange of these rollers is of larger diameter than that of the bottom one, so as to prevent the rope from riding over and causing damage. Rollers with arms 6 inches long, one at each end of the curve, also prevent the rope from getting too high and out of its proper course. The other rope having no clips or forks atached to it is directed round the curve by means of large pulleys suspended from the roof.

For under-rope the best method for guiding the tubs round the curve is to construct it in a similar way to that for the main and tail rope with timber, but of

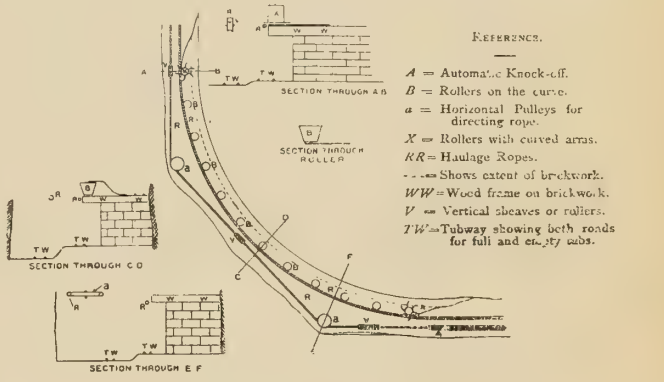

Fig. 15.

CURVE FOR OVER-ROPE.
ENDLESS ROPE HAULAGE

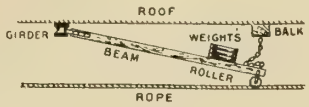
course having the two sets of rails, the outer rails being laid with a falilng gradient as described above, with 9 inch sheaves laid horizontally for the rope.

In both cases the descent of the road should commence 8 or 10 yards back before coming to the beginning of the curve. Small vertical rollers instead of drums, but fixed similarly guide the rope and clips round. The tubs travelling on the outside rails are released from the rope, gravitate round the curve, and are again clipped at the other end. It is necessary to have a boy at each curve to attend to the tubs and rope.

Bearing-down Appliances or Rope Guards.—These are necessary in undulating roads, having alternating dip and rise gradients. In endless over-rope haulage means must be adapted to prevent the rope at points of change in the gradient of the road from springing upward to the roof, thereby disconnecting itself from the tubs either by pulling out the forks or clips or by leaving them, and from scrubbing against the roof or timbers, which might otherwise happen owing to the stress upon it; more especially when hauling up pronounced changes of gradient.

This is effected by suspending a large beam or a revolving drum from the roof at the points of change either of which prevents the rope from unduly rising.

The beam is about 6 feet in length, 12 inches in width, and 3 inches in thickness. One end of the beam is hinged to a girder close to the roof, the other and lower end having a 3 inch diameter roller fixed on its under side is suspended by means of a chain from a balk of timber next the roof, and is weighted sufficiently to overcome the stress of the rope and cause the roller to press on it at one end and the hinge at the other allows the beam to adapt itself to slight oscillations of the rope. (*See Fig. 16.*)



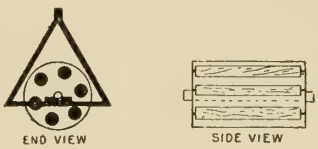


Fig. 16.

Bearing-down Beam.

At the bottom of drifts, a few yards inside of the point where the full tubs are clipped, a drum 2 feet in width, 18 inches in diameter, having six small parallel rollers within it arranged with a point in their circumference flush with that of the drum, revolves vertically just above the tops of the tubs. This keeps the rope down and also allows the tubs to be attached thereto. Sometimes two drums are used, there being a few yards distance between them. On engine planes which have small undulations the use of bearing down appliances may be dispensed with if the road can be levelled by taking up the bottom, or by ripping the roof and filling up hollows in the floor. (*See Fig. 17.*)

Showing Rollers.

Fig. 17.

Bearing-down Drum.

Only jockey clips or forks are trustworthy in use with bearing beams; these clips slide along the underside of the beams and lift them without themselves being disconnected from the tubs.

Methods of Tightening Rope.—In the endless rope system, the single rope used is, as the name implies, endless, passing round pulleys at the extremities of the engine plane without being fixed thereto. Now all ropes are more or less elastic and will stretch more or less according to the stress put upon them by the engine or load; and when the rope stretches, unless means are

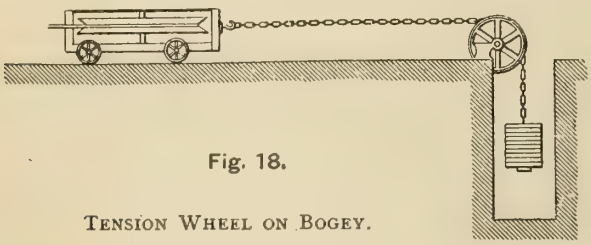

Fig. 18.

Tension Wheel on Bogey.

taken to prevent it, the driving wheel loses its grip upon the rope coiled round it, and revolves without giving motion to the rope. Consequently, tension bogeys, or wheels or weights, are used for taking up the slack from wear, and so keeping the rope tight. The best tightening appliances act automatically.

Tension Bogeys.—These are generally, but not necessarily, put at the inbye end of the haulage road, where they not only serve the useful purpose of maintaining tightness of rope but at the same time also act as return wheels. A tension bogey is made by fixing a pulley wheel in size from 4 to 6 or more feet in diameter, so as to revolve horizontally on a travelling carriage which may be gauged to run on the tub track. It may be placed either overhead for over-rope, or underneath the floor of the road for under-rope, in which latter case it is, of course, securely boarded over. This carriage usually runs on ordinary tub wheels, but in some cases

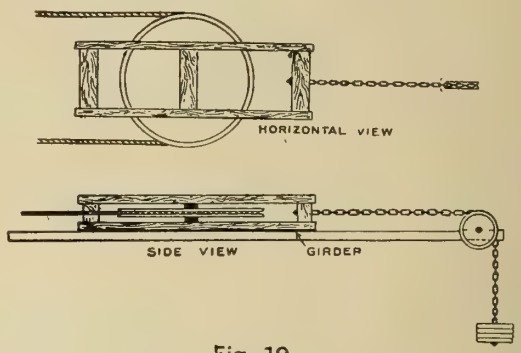

Fig. 19

Tension Wheel on Girders.

slides on a pair of girders of sufficient length to allow the bogey to travel 5 or 6 yards, the haulage rope being coiled 1 1-2 or more times round the bogey pulley. Attached to the inner end of the travelling carriage is a rope or chain which, after being led over a small pulley, is heavily weighted. The weights are sufficient to keep the bogey tight at all times causing it to move forward so as to take up any slackness of rope. (*See Fig. 18 and 19.*)

Screw Wheel.—Sometimes tightness of rope is maintained by means of a tension-screw, one end of which, after passing through a thread in a frame A, is attached to the pulley-carriage B as shown in Fig 20. When the hand-screw C. is turned, the tension-screw is drawn through the frame, and the carriage B may thus be moved forward for a limited distance, determined by the length of the tension-screw. This is not a good tightening plan as it does not act automatically, and therefore must be constantly watched and regulated by

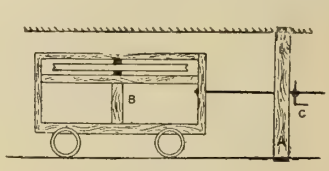

Fig. 20.

Screw Tension Bogey.

an attendant at intervals of time demanded by variations of the rope. Moreover, it cannot be used for a greatly increased length of rope without the appliance being taken down and re-fixed in another position.

Pulleys.—Where the stress upon the rope is not very great, a simple method of maintaining its tightness is by means of a tension pulley arranged as shown in Fig. 21. The rope A is led over the two fixed pulleys B and C, which are each 15 inches in diameter, and under the sliding pulley D placed between the two fixed pulleys. The sliding pulley is free to slide upward and downward in a frame, and has weights E suspended from it

which, under normal conditions, keep this pulley below the level of the fixed pulleys. The exact difference of level is a means of measuring the amount of rope-stretching. It is obvious that when the rope has stretched

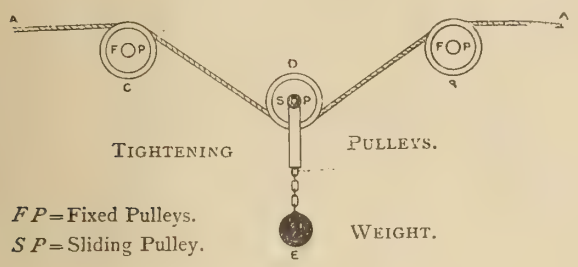

Fig. 21.

TENSION PULLEYS.

sufficiently for the weights to reach the floor this method of tightening becomes inoperative unless provision for their further descent is made by excavation.

ENDLESS ROPE HAULAGE FOR SINGLE ROAD.

In a mine having a bad roof, great difficulty is experienced in carrying wide roadways. It is impossible to introduce an endless rope system of haulage for a double line of rails. In this case a short double siding may be made at both ends of the haulage road, the two being connected by a single line of rails. The tubs can be run in sets of six or more, depending upon the quantity of coal to be despatched from the district and the distance and gradients of the road. The sets are run in a manner similar to that of the main and tail system, but with a continuous rope, and an inward and outward simultaneous travel is impossible. The ropes are carried on rollers underneath the tubs. The two ropes can be made to travel between the rails forming the track with separate rollers for each, the tubs being attached by means of clips, bogey clips being preferable. But in this method separate bogey clips must be used for ingoing and for outgoing sets, one being adapted for use at each side of the road, the inward and outward moving portions of the running rope being about a foot apart and equi-distant from the centre of the roadway. A clip set on a bogey therefore to grip the rope travelling in a particular direction is not applicable for gripping the same rope moving in the opposite direction.

Sometimes in endless single road haulage the rope for the full sets of tubs is carried on rollers in the middle of the tub track and the tubs are attached to it by means of a lever or screw clip, the return side of the rope is carried by the side of the roadway on sheaves and the empty sets of tubs are attached to it by means of a side fork. But in this arrangement there is always danger of the empty tubs being thrown over and derailed.

POSITION OF HAULAGE ENGINE.

Endless Rope.—In endless rope the engine is sometimes erected on the surface and sometimes in the mine, the adoption of the site depending upon local circumstances. Where steam is the motive power and shafts are not above 100 fathoms deeps, then the best position for the engine in on the surafce, with the rope securely boxed in where carried down the shaft. A good compound condensing engine on the surface, fitted with a governor, strong enough to do the work required of it, cannot be rivalled by any expensive electric motor, except where all the engines minus the winding one is driven form a generating station. The weight of the ropes in the shaft 100 fathoms and under is not calculated to exert too heavy a strain on the engine, and where the driving pulleys for the main roads—all connected on one shafting and driven by the shaft rope—are fixed in a suitable position and out of danger, this arrangement cannot be improved upon.

Where it is a deep shaft, then the engine should be placed in the mine close to the shaft, and driven by electricity. The connecting cables between the surface dynamo and underground motor being securely armoured and fixed to the shaft sides.

By this method no heavy ropes are in the shaft, the engine is placed most suitably for its work, and no inconveniently-placed driving pulleys are in the onsetter's way.

Friction clutches of any good make are necessary for disconnecting the driving pulleys when required. whether they be placed at the shaft and worked by the shaft ropes, or are fixed on the main shaft of the underfround engine.

Main and Tail Engines.—For main and tail it is always best to have the engine in the mine close to the shaft, and driven either by steam or electricity, the latter being preferred.

An objection to placing the engine on the surface is that the rope must of necessity be boxed-in in the shaft, consequently, with a high speed haulage, the confined ropes play havoc with the boxes, and in a very short time the continual hammering of the ropes either dislodge or break them, so that they will unless carefully watched for early signs of deterioration fall down the shaft, causing damage to or stoppage of the pit. Even if no injury were thus caused the rope works noisily in the boxes, and in the very place where quietness is most desired—at the shaft bottom. For signalling purposes, too, it is better to have the engine in the mine than on the surface, and placed close to its work.

For depts of 60 fathoms or less steam can be taken down the shaft to the engine without much trouble and without much loss of pressure, provided the pipes are well covered with some good non-conducting material, the only difficulty being that of dealing with the exhaust steam, which is usually conveyed by means of pipes into the upcast shaft. This difficulty is the greater if the upcast shaft is at a considerable distance from the engine. Electricity is the best motive power for an underground engine for main and tail haulage where the shafts are deep, there being no trouble in having the engine and motor in the mine, with heavily-armoured cables in the shaft.

ELECTRICITY FOR HAULAGE.

Electricity has been successfully applied for haulage, especially in the endless rope system. Both continuous and three-phase currents can be used. The former is the better and easier to deal with, especially if the engines are well designed and large enough for their work; there is certainly a liability of its commutator sparking and becoming dangerous, but underground haulage engines are rarely if ever placed in gaseous situations. If it should be so then three-phase motors are the better to adapt as they do not spark, but these are more complicated, and their factor of efficiency is not so high as with the continuous current. But whichever electric system is adapted a much larger margin of power must be provided for than if steam were used, owing to extra strains being put upon the motor when accidents happen to the sets of tubs.

Conclusion.

After thoroughly considering the two systems of haulage and all that may be said for and against them, the writer who has had a great deal of practical and varied experience with both systems and modifications of them, and frankly admitting a preference for main and tail owing to its simplicity and economy has come to the following conclusions as to the circumstances under which he would put in either one or the other.

Where only one or two main haulage roads are to be set away from the shaft in different directions to be driven for some distance, say a quarter of a mile or more inbye before opening out into branch roads, and have still to be extended to considerable distances further in to win large areas of coal, he would in all circumstances put in main and tail.

But where a coal drawing shaft is situated somewhere in the centre of the royalty and with three, four, or more haulage roads radiating from it in different directions, then provided the roof would allow of a double line of way, he would put in an endless rope system, with over-rope where the roads were level or nearly so, and with under-rope where the roads were greatly inclined or undulating.

SMELTER SMOKE, WITH A DISCUSSION OF METHODS FOR LESSENING ITS INJURIOUS EFFECTS.

(Written for the "Mining and Scientific Press by L. S. Austin.)

Anyone accustomed to smelting conditions as they formerly existed in the Western States, is astonished to learn that at the Freiberg smelting works in Germany, which treated but 70 tons of ore daily, complaint was made of the detrimental effect of smelter smoke, and the Government required sulphuric acid works to be erected at the expense of the smelter in order to get rid of the sulphur fumes. In the early experience of silver-lead smelting in the West, oxidized ores only were treated, and later when some roasted ore was added to the charge, the amount of sulphur was relatively small. The matte that was formed was heap-roasted and the smoke from the matte piles, practically containing sulphur dioxide only, caused little complaint. Sometimes the smoke would have a blighting effect when the wind was right for it, and the atmosphere was smoky to the leeward of the piles. Later, as the sulphide ores increased in quantity, they were roasted in hand or machine-rabbled reverberatories, and the fume was discharged from a stack, and thus became so diluted that it was not detrimental to vegetation. With the construction of large works treating thousands of tons of ore, the problem has greatly changed. The commonest ore of copper is chalcopyrite, which for proper self-roasting should contain (as much of it does) 25 to 35 per cent. sulphur. This is not the only drawback. At certain works not only is there sulphur dioxide, but arsenic, to contend with. While the latter cannot be called detrimental to vegetation, still it is poisonous if it falls in sufficient quantity upon vegetation which is to be used for forage. Again, the solid particles, or so-called flue-dust, falling upon the leaves of plants, may seriously injure them. The production of these substances is as follows:—

In both lead and copper blast furnaces the blast, coming up through the charge, makes a good deal of dust, and this in part settles in the flue that leads from the furnace to the stack. The velocity of the escaping gases is, however, too great to permit the settling of the finest particles. In the case of lead furnaces some lead is volatilized and upon cooling, a portion of it condenses upon the surfaces of the flue. The amount of SO_2 produced in lead smelting is not more than 0.2 to 0.5 per cent. The fumes from a copper blast furnace are different in constitution. They contain whatever arsenic has existed in the ore, and sulphur dioxide varying from 0.9 to 2.5 per cent. (At the Washoe plant, Anaconda, it amounts to 1.5 per cent.)

The fumes from roasters are largely SO_2 (up to 2.5 per cent.) produced by the burning of the ore, together with some dust caused (in the case of the McDougall roasters) by the fall of the ore from hearth to hearth, to the agitation due to the rabbles, and to the draft through the furnace. This dust settles in the flue leading to the stack.

In the case of reverberatory furnaces the charge is dropped upon the hearth in a body, so that comparatively little flue-dust is made. Some SO_2 develops as the result of certain reactions, indicated by the frothing or bubbling of the charge as it is melted. At the Washoe plant the percentage formed was 2.08 during the first ten minutes after charging. It drops to 1 per cent. during the succeeding 80 minutes of melting. Ebaugh gives the SO_2 as being but 0.01 per cent., but this must be after the early reactions, and from furnaces where the charges are much more slowly treated.

The smoke, upon leaving the stack, is more or less dissipated according to the velocity of the wind. In still weather it rises rapidly and seems to be carried away at a great elevation. With a moderate breeze it rises slantingly, but fills the air to leeward, while in a high wind part of the smoke will come to the ground at the base of the stack. And thus by this threefold action of the aerial forces, the upward-driving gases in calm, the buoyant but drifting smoke clouds in a moderate breeze, or finally the tumultuous energy of the gale tearing them apart, so that in any case they are dissipated and diffused through a mass of cubic miles of air, all contribute to act intermittently only upon a given area of the soil, so that relief comes to the harrassed vegetation, that it may make fresh effort to resist the next oncoming attack. It can be estimated that at one mile away, allowing 1.5 per cent. as being present in the escaping gases, the dilution (and not counting diffusion) will be such as to give 20 parts of the gas in a billion air.

Prof. Ebaugh has published an article in the Journal of the American Chemical Society, July, 1907, entitled "Gases Against Solids, an Investigation of the Injurious Ingredients in Smelter Smoke," and thinks that "too much emphasis has been laid upon the injurious effect of SO_2, and too little upon the harmful action of the solid

constituents (flue-dust)." He finds the blighting action is greatest in wet weather, least in dry. The losses of crops are not total but partial, and vary from year to year.

Analyses made for SO_2 in the air at distances varying from one to seven miles from the smelting works showed no gas in 60 per cent. of some 500 cases examined:—

60 per cent. contained no gas
12 per cent. contained 1 part of SO_2 in a million
20 per cent. contained 2 to 3 parts of SO_2 in a million
6 per cent. contained 4 to 6 parts of SO_2 in a million

leaving 2 per cent. of cases in which were found 7 to 10 parts of the gas in one million parts of air.

Upon passing air containing 1.5 per cent. of SO_2 over water to the point of saturation, the water at 90 degrees F. took up 0.33 volume of the gas per volume of water, and proportionately less as the air was weaker in gas. There is therefore but little chance of the gas when dissolved in water acting injuriously.

Hazelhoff and Lindau, German authorities, give the following conclusions regarding the action of SO_2 and SO_3 on plants:—

(1) No injury results to the soil nor to the roots of plants.

(2) The gases act by contact on the leaves of plants, and analysis shows that the sulphuric acid content is greater than in smoke-free plants.

(3) The sensitiveness of plants to such action varies with the species and with individuals which may show special immunity (white pines are susceptible, while post and white oaks and red maples are very resistant. Between these come black, red and black-jack oaks and yellow and scrub pines.—Haywood).

(4) Sulphur dioxide, even a few parts in a million, will with long continued action, produce an injurious effect on vegetation. Commonly such action is intermittent and so, less harmful.

(5) The gas acts by wilting the leaves, spots appearing and the leaves eventually turning brown or black and dying off. The SO_2 is probably converted to H_2SO_4 by the oxidizing effect of the leaves having thus a corrosive action upon them.

(6) The action of the gas is more injurious by day than by night.

(7) The action of the gas is cumulative, hence annual plants should be less injured.

In regard to the flue-dust itself, a sample of such dust, taken from the top of a stack, contained as follows:—Moisture, 4.1 per cent.; SO_2 soluble in water, 17.7; total SO_3, 33.9; Fe soluble in water, 3.6; total Fe, 16.7; Cu soluble in water, 1.6; total Cu, 4.2; SiO_2, 28.5; PbO, 8; AsO, 13; ZnO, 15 per cent. This analysis indicates the presence of soluble and insoluble sulphates. Such flue-dust is hygroscopic, taking up water in a saturated atmosphere as follows:—Original H_2O, 4.23 per cent.; after 12 hours, 10.21; after 24 hours, 12.05; after 48 hours, 13.09 per cent. The corrosive power was roughly proportionate to the hygroscopic power. Dust, mixed with water, and sprayed upon sugar beets and alfalfa, showed severe corrosion. If, however, the dust was mixed with soil to the extent of 10 per cent. or less of dust, the corrosive action was small; with 20 per cent. dust in the soil the action was severe.

Thus the finely divided dust or fume from either copper or lead smelting works is extremely corrosive in its effects upon vegetation. Prof. Ebaugh finally concludes: "By no means is sulphur dioxide to be considered harmless, especially in an enclosed place and a moist climate, but we are forced, by the weight of evidence, to the conclusion that heretofore undue influence has been laid upon the injurious effects of sulphur dioxide on growing plants, and that the solid emanations from the smelters, the so-called flue-dust, has been seriously under-estimated."

Haywood in an article entitled[1] "Injury to Vegetation and Animal Life by Smelter Fumes," says, in reference to the presence of arsenic at the Washoe plant, Anaconda: "Ores there treated contain in three instances As 0.51 per cent; As 1.17 per cent.; and As 2.54 per cent."

He found upon the leaves of plants which were to be used for forage:—

Bunch grass, 2 miles north of smelter, 78 parts As in a million.
Red top, 4 miles northeast of smelter, 21 parts As in a million.
Bunch grass, 3 miles east of smelter, 32 parts As in a million.
Bunch grass, 6 miles west of smelter, 42 parts As in a million.
Alfalfa, 10 miles northeast of smelter, 52 parts As in a million.

This corresponds, on a ration of 20 pounds daily, to from 3 to 11 grains of arsenic. However, it does not follow that this amount of flue-dust remains upon the grass, since because it is soluble to the extent of 90 per cent. and upward, rains may remove it, and particularly in harvesting, because of the frequent handling in curing, hauling, and stacking, the larger part of the dust would be shaken off the hay before it was fed to the cattle.[2] We may conclude, therefore, that in those localities where smelters do injury, farmers should adopt the soiling or stall-feeding system.

The smelting companies have been compelled by the troubles they have had with farmers, to cast about for methods of avoiding these difficulties, and have worked out the problem in different ways. As I have elsewhere stated, the farmers may be divided into three classes:—

First, those who do not feel they are damaged.

Second, those who honestly believe they are.

Finally, those who, while they do not believe it, make claims for the money there is in so doing. In Germany, for example, damages have been collected by cultivators, who have set out their grounds with expensive ornamental flowers unsuited to the climate, and which have no chance of prospering, in order to profit by damages for destruction by smoke.

The remedies that have been proposed may be thus enumerated:—

(1) Manufacturing the SO_2 into sulphuric acid to be sold as an article of commerce.

(2) Operating the smelting works in a barren country where the fumes will do minimum damage.

(3) Roasting the ore where the country is barren, thus removing most of the sulphur (to 10 per cent. or less) from the ore, then treating the roasted ore at a works convenient to labor and supplies.

(4) Roasting the ore at a works convenient to labor and supplies, discharging the resultant SO_2 by a high stack, then smelting the roasted ore, but filtering the fumes from this last operation by means of a bag-house.

(5) Filtering all fume resulting both from roasting and smelting.

(6) Introducing plants and animals best suited to withstanding the fume; adopting stall-feeding in place of grazing.

(1) This method may do well where there is a sufficient market for the sulphuric acid produced by the works. However, a large part of, say, 1,000 tons of ore daily would produce acid in excess of any probable demand. Besides this, only such SO_2 as was produced in roasting could be utilized, while the fume and flue-dust from the smelting would still do injury and would have to be filtered out.

(2) This was adopted at the Garfield plant of the American Smelter Securities Company, at Garfield, Utah, 18 miles from Salt Lake City. The land, especially in the path of the prevailing winds, was brought up by the company, which then proceeded to the erection of an expensive plant for the treatment of copper ore. The fume was removed by a stack the top of which is at a level some 600 feet above the works. The fume is thus diluted before it can touch land beyond the acquired portion. In a way, the experiment has proved to be an expensive one, since the company has been obliged to build a town for housing the employees; and at this distance from Salt Lake City, it is hard to get good labor, as well as hard to keep it. It is true that the company obtains a profit from its investment in the houses and in its town, but this is not the line of business into which it had intended to go.

(3) This method has been proposed where there are existing works that, because of the large amount of sulphur fume produced, have been serious offenders. If the ore can be roasted near the mine, for example, where the land is not used in agriculture, the damage becomes comparatively trifling, and the work of roasting requires but little labor. The operations of smelting and of converting the product can then be conducted where supplies and skilled labor are available.

(4) Prof. Ebaugh's experiments go to show that SO_2 gas alone may not cause radical injuries to plants and certainly not to animals, provided it is free from flue-dust. Indeed, according to Merrill's experiments[3] in the smelter zone, with stock properly fed and cared for, the animals flourish quite as well as elsewhere. If then the SO_2 gas from the roasters is allowed to escape freely into the air, it means that the main bulk of gases is thus disposed of. An ore containing 30 per cent. sulphur can thus be reduced to 7 per cent. If we smelt and convert this roasted ore, we may easily filter the small volume now remaining to be handled as referred to in method No. 3.

(5) At the American Zinc Works, near Canyon City, Colorado, the company has for years filtered all the gases from their roasters and blast furnaces, the latter being purposely run to make all the zinc and lead fume possible. These gases are first cooled to the proper temperature, both by passing through sheet metal flues and by the admixture of fresh air, then having been filtered at the bag-house, there is no smoke visible. This is also true of the bag-house installed in connection with lead-smelting plants. Where works thus provided deliver visible smoke, it is that coming from the roaster stack. Even this can be filtered, but it is a more difficult problem, the bag-house needing to be fitted with the more expensive woollen bags, which stand the attack of the corrosive sulphates and sulphuric acid, and small as is the quantity of them produced, cotton bags would be readily corroded. Still, even in large works, all the fumes can be filtered. By so doing, not only the flue-dust but the arsenic can be god rid of. The flue-dust collected in the "pits" at the bottom of the house contain a large percentage of arsenic, and such flue-dust is to be sent away where it may be safely treated, or the whole product buried, thrown into an abandoned shaft, or otherwise got rid of.

(6) It has already been shown that there is a great difference in the resistant power of plants to the fumes, and this power varies both with the species and with individuals. Especially where the land is owned or can be controlled by the offending smelting company, it should be good policy to plant those species of trees most resistant to the smoke. Forage plants should be selected in the same way and cattle should be stall-fed, rather than be permitted to pasture upon them. Root crops, as sugar beets, should be raised, since while the leaves of these plants may be damaged, it will not be to the extent of preventing a profitable growth of the plant. As far as the forage plants are concerned, the damage to the leaves varies, and is often so slight as to make little difference in the value of the plant for fodder.

In conclusion, we may consider the findings of the Master in Chancery, Oliver Crane, to whom was referred the matter of damages due to smelter smoke from the Washoe plant. He finds that the farmers had been somewhat damaged by the arsenic, but not by the SO_2 contained in the smoke. He says that an injunction and the closing of the smelters would damage the farmers and the community more than a continuance of the nuisance complained of; that the company had been doing what it could to avoid damages, and that the smelter is built on a site where it will do less damage than any other available place, and that the company has always been willing to pay some damages.

TECHNICAL EDUCATION AND THE FEDERAL GOVERNMENT.

At the annual dinner of the Engineering Society of Queen's University, Dr. W. L. Goodwin, in the course of a vigorous speech, suggested some ways in which Federal assistance could be extended to the cause of technical education. Dr. Goodwin took care to point out that, if control of the educative system is left with the Provincial authorities, there is nothing in the British North America Act to prevent such assistance being granted. Further, the speaker demonstrated that already the need and the principle have been recognized in the establishment of Federal agricultural, forestry, marine, biological and other similar stations. These may be fairly described as institutions for the advancement of science and scientific education.

The following excerpt from Dr. Goodwin's speech bears upon the above points and contains a series of very important and useful proposals:—

"It is natural that our particular interest should be in the advancement of scientific education. In this, Canada has made and is making great strides; but I doubt if she is keeping pace in this respect with industrial expansion, growth of population, and applications of science to industries. There is no general system of technical education of the secondary grade, there are very few attempts at trades schools, and even the higher scientific education is left to a few universities, most, if not all, of which are undermanned and insufficiently equipped. Some of the Provinces are doing their best to

meet the situation; but under our constitution Provincial revenues are not very elastic, while the Dominion revenues grow with the increase in the wealth and population of the country.

"It would seem then that this is an occasion for some Canadian Colbert—some far-seeing stateman—who will inaugurate a complete system of Dominion aid to scientific and technical education. There is nothing in the British North America Act to the contrary, provided control of the educative systems is left in the hands of the Provinces. Control is one thing—aid is another. That the principle has been already recognized is shown in the existence of the various Dominion agricultural, forestry, and other stations, which are really a means of scientific education, and are recognized as such, particularly in the case of the marine biographical stations. I venture to suggest some of the ways in which Dominion aid could be extended:—

"1. Grants to Provinces or municipalities for the establishment and maintenance of trades schools, or grants to existing schools to extend and improve them.

"2. An experimental forest in every Province, with station and staff, available for professors and students of all universities.

"3. Extension of marine biological stations, so as to include more of our coast waters and great lakes—permanent stations, with hatcheries and abundant opportunities for scientific investigation.

"4. Grants to universities and scientific schools to sustain research fellowships and professorships, and to maintain certain technical departments, such as standardization of instruments, standard testing of wheat, flour, etc., and the departments of practical science, as they are of general value to our country's industries."

THE ECONOMIC DISTRIBUTION OF ELECTRIC POWER FROM BLAST FURNACES.

By B. H. Thwaite, Assoc. M. Inst. C.E. (London).

Although in numerous papers and articles contributed since 1894, and in his evidence given before the Royal Commission on Coal Supplies, the author has reiterated the statement that blast furnaces should be made as far as possible the source of power for manufacturing industries situated within a certain area of such furnaces, it has always been realized that where such blast furnaces were associated with steel works and rolling mills there was until last year an unfinished link that prevented the full chain of possible benefits from being completed, in the fact that the heavy rolling mills had not been electrically harnessed.

Fortunately this unfinished link has at last been forged, for which thanks are due to the enterprise of continental electrical firms. To those who strive with more or less strenuousness for the prevention of waste of fuel and of power, and the reduction of the incubus of dead charges on working costs, the successful solution of the problem of harnessing electric energy for driving heavy rolling mills is a fact of great economic significance.

The heat and power efficiency of existing rolling mills is deplorably low. The associated steam boiler plant necessary to satisfy the maximum requirements of a rolling mill operation and the effect of condensation in steam pipes means a heavy thermal loss.

Before the date of the actual proof that blast furnace waste gas could be directly converted into power with an expenditure of 70,000 to 80,000 British thermal units per indicated horse-power hour (equivalent to a reduction of as 10 is to 30 compared with a good steam power plant), the waste of energy involved in ordinary rolling mill plants was a matter of indifference, because the waste of heat about balanced the supply—indeed the power available from the blast furnace gases had often to be supplemented by coal; but now that it is realized how valuable, as a power agent, this gas has become, the waste of fuel is morally and financially inexcusable.

Unlike the blast furnace (which may work steadily on, year in and year out, without week-end or other stoppages), the rolling mill may or may not remain steadily employed: a paucity of orders may mean the closing down of the mill for weeks, because, although pig iron may be stocked with little or no risk, it is not usual to stock mill products which may never be wanted. During this non-operating period the blast furnace gas used for firing the steam boilers is set free or blown into the air. This waste of fuel may be cut down considerably, if not entirely, by the application of the pooling system to be described, which involves the displacement of steam by gas power. Modern gas power electrification methods will set free a great volume of gas which, thermo-dynamically converted in a gas engine, will increase the power equivalent of such gas by 300 to 400 per cent.

The objection that is advanced against the gas-power electrification of the rolling mills relates to the heavy expenditure involved in such a technical reform. The objection is a real one, and unless removed or reduced, will tend to confine the advantages of application to firms of immense financial resources. Few British joint stock administrators would be permitted by their shareholders to risk the investment. But if it can be shown that for some iron-making concerns it will be possible to reduce the capital investment to the amount necessary to provide the equipment of the new rolls with electric motors, as distinct from the electric generators, and that such an investment will be financially well justified, the objection standing in the way of such electrification will be considered, even by the most cautious and conservative of managements, as of no deterrent consequence.

The author's proposal, first suggested in 1894 and 1898, repeated at different times since, and again to be described here, would, as an incident, secure a substantial reduction of the expenditure of a complete electric equipment of an iron and steel works, so as to cover all power demands.

The basis of this programme is to pool the waste furnace gases from all the furnaces of an iron-making district independently of the ownership of such furnaces. The energy (electrically transformed) of the different furnaces would be transmitted to a central distributing and transforming station, in which the current would be

transformed to the voltage to satisfy different customers. Of course there may be cases where the furnaces are so concentrated as to justify the delivery of the furnace gases to a pooling or central station for conversion into electrical energy, but usually it would be found to be more practical to transform the gas into electrical energy on the site of the ironworks, for transmission to a distributing central station. (See Fig. 1.)

The first call on this power would of course be the satisfaction of the internal demands of the iron and steel works, the balance of power remaining being available for external distribution over a wide area, the extent of which, owing to the familiarity with and knowledge of the resources and safety of high pressure transmission systems, is being yearly increasd. When the author put forward the first long distance electrical transmission project of over 100 miles in 1892, the line pressure then suggested was considered dangerous in the extreme; to-day, power is being easily and profitably transmitted over varying distances at very much higher pressures

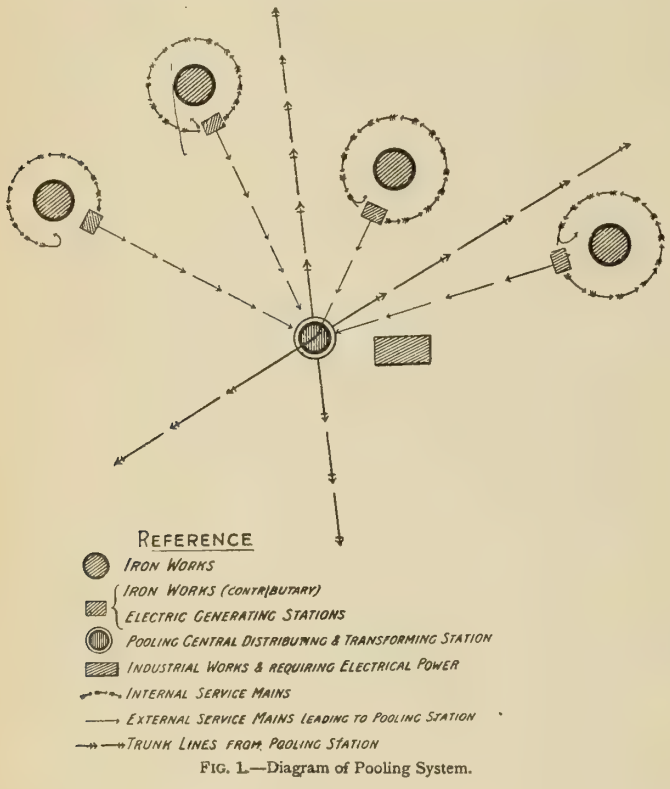

FIG. 1.—Diagram of Pooling System.

than those suggested in 1892. In 1892 the pressure specified was 20,000 volts; to-day, transmissions of 250 miles with 88,000 volts pressure are in daily service.

The pooling programme proposed would be provided by a separate and distinctive joint stock electric power organization, on the lines of the county electric power companies, which sprang from the author's 1892 proposition, with the exception that a proportion of the output is preferentially allocated to the satisfaction of the power demands of the iron and steel works from which the gases are drawn. The balance could be transmitted to any group of customers whose power demands justified the cost of distributing mains and associated transforming stations, but a more appropriate field of demand for an all-the-year supply would be the satisfaction of the electric energy requirements of the many profitable electro-chemical and electro-fusion processes described in the author's paper read before this Institute at Glasgow in 1901.[1]

Included amongst these processes, in which the demand for power would correlate with its production at the blast furnace, or from January 1 to December 31, there are the production of high class steel from selected scrap, special alloys, such as ferro-silicon and ferro-titanium, ferro-chromium, besides the production of carbides (silicon and calcium). Some of these processes could take the current just as supplied, in large or small proportions, and at any moment, so that the levelling up of the load or the demand could be readily effected—obviously an important factor in the economic production and sale of electricity.

In the selection of the customers it would be advisable to secure the class of demand for operations such as mine pumping, electrolytic and like processes, on which the supply could be turned on or off whenever available, so that the distribution of the current could be arranged to fill up any gaps in the demand.

As an example of the kind of power demands that would be found in an average field of industrial operation surrounding iron works, exclusive of the municipal and rural demands for current for lighting and tramway power purposes, the following is given to represent a German district for which the pooling system was first outlined by the author:—

	Electric Horse-power.
For the coal mines in the district.....	1,300
Chemical (metallurgical) requirements	2,500
Electro-chemical requirements	1,500
Works and town electric lighting	500

In large districts, the power-driving requirements of the factories would provide a demand running into thousands of horse-power, although the direct driving of important machinery will secure a great saving of (and consequent reduced demand for) power compared with belt driving and its associated power losses. The satisfaction of electric transport power requirements is becoming an increasing factor both for water and rail transport services. By this pooling system the tall stacks of the furnaces would become centres from which would radiate the benefits of the cheap power; and the advantages would be reciprocal. Besides removing the many smokestack polluters of the atmosphere, the additional profit would increase the stability of the iron industry in this country.

The flexible demand for power which it would be the aim of the power organization to secure would be appropriate for the intermittent periods of mill idleness, whether temporary or prolonged; for instance, the sudden release of power for external services at the week-end periods of mill idleness (or during longer periods of compulsory idleness due to the falling off or cessation of orders) would be available for one or other of these flexible power demands.

(To be continued.)

Mr. E. Jacobs, editor of the "B. C. Mining Record," recently visited the Tyee Copper Company's smelter, at Ladysmith, B. C., where he reports, extensive improvements, including additional ore bunkers, increased wharfage facilities and the installation of new machinery, are being made. The proposed doubling of the smelting capacity of the works will probably be undertaken ere long. The recent additions and improvements, were meanwhile designed by Mr. W. J. Watson, manager of the smelter, and the plans drawn by Mr. George Williams, mechanical engineer, of Victoria.

MANCHESTER GEOLOGICAL AND MINING SOCIETY.

At the meeting of the Manchester Geological and Mining Society, held on Tuesday, November 12th, in the society's rooms, 5 John Dalton street, Manchester, the newly elected president, Mr. James Ashworth, C.E., delivered his presidential address.

He spoke in part as follows:—

"My address will be rather as a mining man than as a geologist. The various matters relating to the regulations and working of mines are too familiar to you to require anything in the nature of a review from me. We can still congratulate ourselves that this country continues to hold the first place in respect of regulations for the safe working of mines. This point was conceded at the recent Miners' Congress at Salzburg. I am, however, afraid that the proposal of the Belgian representative at this congress, 'That coal production should be regulated by international laws,' will not prove a very workable proposition, although it secured the moral support of most of the delegates. It is also worthy of note that King Edward has created a new medal for gallantry in mines and quarries. The warrant states that the King is 'desirous of distinguishing by some mark of our Royal favor the many heroic acts performed by miners and quarrymen and others who endanger their own lives in saving or endeavoring to save the lives of others from perils in mines or quarries within our dominions and in territories under our protection or jurisdiction.' The new medal will be of two classes, to be designated 'The Edward Medal of the First Class,' in silver, and 'The Edward Medal of the Second Class,' in bronze. This indicates his Majesty's great interest in the efforts made to reduce the danger and the death roll in collieries, and such encouragement has been applauded and approved by everyone connected with mining.

"Mining men in this country are in many cases looking anxiously for the report of the Commission now taking evidence on the safety of mines. The subjects of rescue apparatus and the best treatment of coal dust, continue to excite the keenest interest, and a preliminary report on the first subject has already been issued. It is to be feared that far too much is expected to result from the apparatus, the cheapest of which is very expensive. Up to now there does not apear to be more than one instance of the saving of the life of a miner by this class of apparatus, and this occurred in an Australian mine at Bonnieville. Doubtless, rescue apparatus will be found of great advantage in the case of gob fires and other similar occurrences underground, but it seems curious that a simple, inexpensive apparatus called the Denayrouse, which was introduced into the country many years ago, was not brought before the present Commission. On the general subject of rescue work in mines it seems to me that a great deal more might be done by the Home Office in apportioning a considerable sum of money per annum for scientific investigations, which would materially tend to increase the safety of the persons engaged in our great industry.

"With respect to the attitude of capital and labor, I think you will have noticed there is a strong desire growing up amongst all sections of the community that courts of arbitration should be formed to settle industrial disputes rather than having to resort to the barbarous practice of strikes. This point was very clearly brought out in Mr. Enoch Edward's speech at Southport, when he strongly suggested the settlement of disputes by means of reason and conciliation rather than striking first and adopting reason and conciliation after.

"The Miners' Eight Hour Day Bill will probably become law during the next session, and although the conclusions of the Parliamentary Committee make light of the assumed loss on production of 25,783,000 tons calculated on the output for 1906, it is not denied that considerable loss will inevitably follow the adoption of such a measure, and many other expedients are suggested for mitigating the effects of the proposed reduction in the time underground. The employers' remedy lies apparently in the extended use of labor-saving machinery —coal-cutting machines and conveyors—and in the improved mechanical equipment of the mines generally. The committee admit that certain temporary and permanent relaxations of the rigid rule might be found necessary in the interest of safe working, and that the conditions are variable to such an extent that the special regulations would be required for certain districts. From many of these conclusions it is clear that the operation of law will not remove all the intricacies of the existing systems, and a hard-and-fast limit of working time will be found detrimental to the industry, both from the point of view of the employer and that of the employed. And further, is there not some reason in all these considerations for the feeling (that many of us have), that these processes of restriction, this law-pervading atmosphere dominating our industrial and social life, is destroying in our race and nationality that individualism, that spirit of self-reliance and of self-restraint which, beyond doubt, have had much to do with the industrial as well as the national development of England? We move in days of big combines and trusts, where everything is done by concerted moves, and where, except in a few brilliant instances, personality is submerged and operations are performed mechanically. The danger I apprehend is loss of character by the reduction of the personal element in our undertakings, and if we look upon our national industries not merely as means whereby men may rapidly and selfishly accumulate wealth, but also as means of intercommunication of sympathies and goodfellowship between capital and labor, which after all should be one of the principal motives of our commercial aims and pursuits, the danger to which I refer becomes a live one and one which philanthropic capitalists might well direct attention. We cannot be unmindful of the service rendered by the workers in the days when legal ties and binding clauses were almost, if not, quite unknown, and when labor was performed from a sense of duty sufficiently strong to keep the worker at his post and assist in the wonderful development that has characterized modern English history.

"Let us for a moment reflect on the great and rapid change made in England by the coal-miner. Has he not completly revolutionized our land and turned a large part of an agricultural country into a huge workshop. Only one hundred and fifty years ago Lancashire was the poorest country in England, and the most sparsely populated. To-day if you take an area of 50 miles round this room you enclose a population more dense than any other part of the world. You may liken it to one big workshop built on a coal hole. The miner has mainly effected this change. This change has brought with it many problems, and one is tempted to ask whether some of us have not lingered too long on the slopes of the Pennine Chain? Is there any outlet for this congested population? I venture to think there is; but it is not in Old England, but in New England be-

yond the sea—a land that covers one-fifteenth of that of the the world, and yet has not a total population of London to-day. I refer to Canada. It seems to me that the miner would do well to turn his attention more assiduously to this vast dominion, for in my opinion it will prove to be one of the most solid and enduring jewels in the British Crown. It is a happy omen that the 1908 summer meeting of the Canadian Mining Institute is to be held to some extent under the Government auspices, and promises to be a most important one and worthy of the best representation from this country. It is for us, and especially the younger amongst us, whose field of observation is widening out, to mark, learn, and inwardly digest every phase of mining activity, every fresh means adopted to meet a particular contingency, and to apply the beneficial result of their observations to the work in hand. In order to acquire this experience, it is absolutely necessary that fresh fields should be sought and appropriated; the situation is one which should have a peculiar attraction for the young mining engineer or colliery manager, whose steps should be directed towards new fields, where his energy can find full development. Could he have better prospects than in Canada? After every visit I have paid to this vast dominion, I have returned more impressed with its possibilities, and if I can only arouse your interest, I feel sure that you will agree with me, that Canada is the country of the future, for our surplus population, and that the Lancashire man, especially the miner, will do well to give it his serious attention."

Grouping Nova Scotia, New Brunswick and Prince Edward Island together as Acadia, or the Land of Plenty, the president said:—

"Of all the numerous British colonies, this region presents the strongest family likeness to the Mother Country, not only in the singular variety of its resources, but also in its proximity to the markets of the world. Gold, which excels in purity that of Australia and Califoria, is found here. It is here we have unequalled fisheries, safe harbors, extensive coal fields near the water's edge, and, above all, a position almost midway on the very highway between the Old and the Pacific side of the New World, and I am one of those who believe that Acadia will inherit a full share of that greatness which Britain in her old age must resign. Though it cannot be said to have yet attained the prosperity predicted for it, this region is to-day by no means an insignificant contributor to Canadian wealth, for of the total number of miners engaged in Canada, 42 per cent, find occupation in Nova Scotia. Coal is the staple mineral, and the Cape Breton, Cumberland and Pictou fields provide a fair proportion of the whole output. In Cape Breton coal is obtained in great qauntity from the Sydney and Inverness fields. The Sydney field was the first exploited, operations dating from the year 1785. In 1863 the output of coal for Cape Breton was 214,812 tons; to-day it is over 4 million tons. The other fields in this district of Acadia are responsible for a little more than a million tons, or a quarter of the Cape Breton output. The coal measures of the Cumberland area outcrop on the seashore, and have been worked extensively at the Joggins mines, where a seam of about 6 feet of coal has yielded an annual output of about 80,000 tons. The Pictou field, opened up in 1827, by the General Mining Association, is about eleven miles long, three miles wide, at its broadest part, and covers an area of about 22 square miles. Its structure presents many interesting features, and a few problems, some of which are—the remarkable thickness of the seams (in some cases 40feet); the extensive deposits of black and brown shale, the marked changes in these deposits noted at comparatively short distances; the nature of the dip —ever changing, but always considerable, and the numerous large and small faults intersecting the field at many points. The three coal producing districts of this field are the Albion, the Westville and the Vale. The coals vary in character, but are all the bituminous coking variety. Some tested at the Gas Light & Coke Company's Works, London, have yielded 10,450 cubic feet of 15-candle power per ton. Slack is valuable for blacksmith's purposes. The firey nature of the seams has necessitated the use of fans of large capacity and modern construction in place of underground furnaces. Mueseler, Marsaut and other lamps have been in use for many years. Quite recently the local papers announced that the Dominion Coal Company, whose annual output is about 3 1-2 million tons, has a representative in this country busily seeking to enlist an army of 2,000 miners for their collieries in Nova Scotia. Lancashire, Yorkshire and Staffordshire men are preferred, it is said, as being more accustomed to the long-wall system, which is the system of working in this part of the Dominion."

The president proceeded to discuss the other resources of this district, and speaking of Ontario, he said that:—

"Extensive iron ore deposits are worked at the Helen Mine, Michipicoten, along the line of Kingston and Pembroke and Central Ontario Railway, and smelted at Sault Ste. Marie Furnace & Steel Works, and Port Arthur Ironworks. Twenty miles north of the famous nickel district, iron ore is also found in the Moose Mountains (rocks of Keewatin age), and a railway only is required to make the Canadian iron ore certain of admittance into all markets. The proportion of iron in the ore is 60 per cent. No coal had been discovered in this province until quite recently, when lignitic coal was found near Lake Abitibi. It is reported that a mineral smelting plant is to be erected near to Toronto, which would provide employment for 15,000 men, treating 1,400 tons of ore daily."

Going further westward he said:—

"Though primarily the granary of the empire, Manitoba and the North-West Provinces are not bereft of mineral wealth, as they are underlaid by rich stores of lignite—which is a useful fuel for the cities and farming scattered population. Saskatchewan and Alberta, the two new provinces, each have an area of more than twice the size of the British Isles, but only a very small portion of the rich arble land is as yet under cultivation, nevertheless in 1906 the population had increased from a few hundreds in 1890 to nearly 500,000. In Alberta there are inexhaustible deposits of lignitic coal. The principal developments of anthracite and bituminous coal have been made in the neighborhoods of Banff, Frank and Coleman, and to a smaller extent between Calgary and Edmonton.

"Considerable deposits of iron ore have been discovered in Alberta, and this suggests an industrial as well as an agricultural future for this district."

Other districts in Canada were mentioned as fields of enterprise, and the president passed on to speak of British Columbia as offering great attractions to the miner, and in conclusion he urged the importance of Britishers not letting the control of any of these rich coal areas pass into the hands of Americans.

"I have now taken you," the president said, "across the continent, from coast to coast, and although we have quickly examined the localities of the most important minerals, a vast amount of exceedingly interesting in

formation on mining progress has necessarily been omitted. The principal object of my address is to endeavor to bring before your notice something of the immensity of the value of our Canadian possessions with a view to impressing upon you the importance of the direct investment of English capital into Canada, instead of though New York and other Stock Exchanges as at the present time, for the danger is that Americans wil secure the command, through capital, of the mining and other undertakings. If this country is to have and keep the controlling power, then it is essential that she should hold the purse-strings. The latest news from the famous Crows' Nest district, report huge beds of coal above the railway, and the Pennsylvania miner sees in this district—if the British speculator cannot—great beds of coal more than equalling the enormous deposits of his own State. There was, and is, a great truth underlying the remark made by the Prince of Wales in reference to his Canadian visit, that 'England must wake up,' otherwise she will fail in her duty to the Dependencies."

THE COLLIERY GUARDIAN.

"HUSTLING" TO "RECEIVERSHIP."

ALEX. GRAY, Montreal.

Were he not the chief of the coterie of London mining financiers, the remarks of Sir Julius Wernher at the annual meeting of Fraser & Chalmers, Limited, held in London on November 14th, might go unnoticed. Because he is the senior member of Messrs. Wernher, Beit & Company, and therefore associated with very great industrial enterprises and higher technical institutions of learning, his reflections invite serious consideration and rebuttal. He represents the investing and speculative public, is one of the life governors of De Beers, has large interests apart from mining, and possesses the confidence of bankers on the continent. Naturally, therefore, his utterances carry weight, and on this account it is as well for all now concerned that he unbosomed himself in thus explaining away a comparatively insignificant falling off in the net profits for the year of Fraser & Chalmers:—

"Their investment in the Allis-Chalmers Company remained, unfortunately, unaltered. He said, unfortunately, because the shares had had a heavy drop, and again there was no dividend. If things looked black for the moment in America, let them remember that in spite of everything that was happening there the country itself was as sound as ever. Speaking generally, it suited us on this side to crawl into moderate prosperity *than to 'hustle' into receivership.* He hoped, therefore, that the shareholders would not be altogether dissatisfied with the modest 10 per cent. and a sound financial position which the board offered them that day as the result of the year's work."

Whatever the relation be between the British section of the business originally conducted under the aegis of Fraser & Chalmers—the Canadian-American department being included in the Allis-Chalmers-Bullock Corporation—the inference is plain that Sir Julius deprecates trans-Atlantic methods and capitalizations. He was epigrammatic, and at the expense of those "hustlers," some of whom recently took over the City of Mexico street railway system, in which Messrs. Wernher, Beit & Company were decisive elements. There being no dividends, a rather unfair analogy was drawn between "hustling" and "receiverships," whereas the magnitude of Canadian-American undertakings is the soundest argument under the circumstances, why distributions should be deferred until the financial outlook is clearer. The "country is sound."

Without special knowledge of the position in corporate counting houses, it may well be assumed that huge capital commitments and inevitable credits do not make for dividends when currency is at a premium and overdrafts inaccessible on other than usurious terms. Undoubtedly the firm of Wernher, Beit & Company have never been heavy borrowers, their income from De Beers and kindred ventures yielding continuous returns; but Sir Julius should be chastened in spirit in view of the "hustle" manifested in the underwriting and distribution of mining shares and the prevailing market quotations for many of those shares. For this he is hardly at fault. He stands for the credit of the Witwatersrand Gold Fields and Kimberley Diamond Fields. When the Wernher-Beit "deep levels" were "hustled" into existence, six or ten years ago, without developments or dividends, "receiverships" were not thought of. When the Central Mining Trust was underwritten because it was sponsored by Wernher, Beit & Company, it was taken for granted by subscribers that the premiums they paid would be infinitesimal compared with the dividends they would receive. Instead of this there have been depreciations and writings off, and dignified disavowals therefor emanating from Sir Julius, whose entire career has been marked by honor and candor. When Rand "deeps" were promoted labor troubles and financial depression growing out of the South African, Russo-Japanese and American difficulties were not included in the list of possibilities, any more than the inability of the Westinghouse and Alils-Chalmers Companies to earn fancy dividends and suitably finance themselves in stressful times.

Sir Julius recognizes the impossibility of "hustling" governments into doing the sensible thing rather than precipitate thousands of holders of South African shares into the bankruptcy courts. His chief of staff in Messrs. Fraser & Chalmers, Limited, Mr. Walter McDermott, chose the more intelligent, and certainly more logical attitude, when he said at the same meeting—though before Sir Julius arrived:—

"Those who followed the great South African gold industry would have noticed that the producing companies were doing in the aggregate as well as, or even better than, ever before, but there was *little new enterprise for want of capital, and consequently orders for new installations were few and far between.* He was sure in his own mind that this would not last, and he quite shared the opinion lately expressed by a prominent South African that there were hundreds of millions of pounds worth of gold waiting extraction; that ore worth down to 5 dwts. and perhaps below would be found profitable to work, and to do so more machinery would be required, but it would all take time, and they must have patience."

No less distinguished as the ex-president of the London Institute of Mining, and a director of the Mines Selection, Limited, Mr. McDermott as a general manager of Fraser & Chalmers, Limited, touched the tender spot when he dwelt upon the scarcity of fresh undertakings owing to the "want of capital." In this instance the mining houses "want the capital," the machinery manufacturers find that "orders for new installations "are few and far between"; but there is no presumption that the "hustling" of share issues has the slightest relationship to "receiverships." Nor will there be occasion to requisition innumerable "receivers" on this side of the water. "Every month less progress," as Mr. McDermott expressed it. Whatever inflation there has been was not confined to Canada and America. More reor-

ganizations and amalgamations have been consummated, or are contemplated elsewhere, than may be necessary over here if there is less haste for recovery from present complexities.

Sir Julius must not depart from his role of "guide, philosepher and friend" to the greatest gold-getting industry the world has seen—or will see. South Africa will be all right. Canada is all right. The United States will be all right—when enough Witwatersrand gold has been drafted thence.

PRODUCTION OF ANTIMONY IN 1906.

By far the greatest amount of antimony produced in the United States from domestic ores is that contained in antimonial lead. During 1906 a production of 10,546 tons of antimonial lead, containing 1362 tons of antimany, was reported by the refineries of the country. It is estimated that about one-fourth of this was produced from foreign ores, so that the production from domestic ores was about 1021 tons. This quantity was about half that produced during any year for the preceding five years and was less than the trade requirements, so that metallic antimony was melted with lead to supply the demand.

Most of this antimonial lead was used in making antifriction metals, but it also finds use in storage batteries, for lining lead chambers in making sulphuric acid, and in making toys and coffin trimmings.

Antimony combines readily with many metals, from some of which it may be easily volatilized under the heat of the blow pipe. Antimony has the property of hardening lead when melted with it, and in the smelting of antimonial ores much hard lead is produced. Alloys of antimony and lead expand on solidifying and make excellent metal from which to cast type, since it will fill the corners of mould . Type metal contains varying quantities of antimony, generally less than 40 per cent., alloyed with tin, lead, and sometimes copper, zinc, bismuth and nickel. Britannia metal and pewter, formerly much used for table ware, are also alloys containing antimony.

Up to the present time the United States has been but a small producer of antimony, owing to the low price of the metal, to the distance of the known domestic deposits from market, and to the low cost of production from extensive deposits in other countries. Hence it has been only in times of high prices that the deposits in the United States could be worked at a profit; and although there is a constant increase in transportation facilities and the metallurgy of antimony is becoming better known, it does not seem likely that there will be much increase in domestic production in the near future.

The remarkable rise in the price of antimony which began in 1905 continued in 1906 and stimulated production greatly, but toward the end of the year the price fell. Sudden changes in price, however, have been common in the history of the antimony market.

DOMESTIC PRDUCTION OF ARSENIC.

Thousands of tons of arsenic are wasted annually in the fumes that pour from the stacks of the great smelters of the United States, yet notwithstanding this waste, or perhaps because of it, more than 8,000,000 pounds of arsenic and arsenic compounds, costing about $375,000, were imported into this country in 1906. The domestic production for the same period was only a little more than one-sixth of the quantity imported and was valued at but $63,460.

Arsenic ores are widely distributed, particularly in the granitic and highly metamorphosed rocks, and ores of tin, copper, and antimony are frequently accompanied by those of arsenic. Native arsenic, a tin-white brittle substance occupying a place midway between the metals and the non-metals, is found sparingly in veins at a number of places, but it is not important as an ore.

France, England, Germany, Portugal, Spain, Turkey, Canada, and the United States are the principal producing countries.

In the United States, and also in England, the great bulk of the arsenic produced is obtained from smelter fumes. English smelters are not allowed to pour arsenical fumes into the atmosphere, and compliance with the law gives added profit from the white arsenic saved. There are, however, but two smelters in this country that have plants for saving it—the huge Washoe smelter at Anaconda, Mont., and the smelter at Everett, Wash. A smaller plant, located at Mineral, Lewis County, Wash., makes white arsenic from realgar. The only other known arsenic production in this country in 1906 was a few hundred tons of arsenical pyrite mined at Pine Pond, town of Kent, Putnam County, N.Y., and this pyrite was shipped abroad. As ordinarily applied the term 'arsenic" means "white arsenic" or "arensious acid," or arsenic trioxide (As_2O_3). It is used as an insecticide in the preservation of hides and stuffed skins of animals and birds, in sheep and cattle dips, in arsenic soap, and as a wool preservative, where it also prevents fungoid growth. It is also used to prevent the growth of weeds and grass, in the making of some enamels and in the manufacture of glass, as a fixer or conveyer of aniline colors in calico printing, and as a constituent of the dyes themselves.

The greatest demand for arsenic is for making Paris green, used as a pigment and as an insecticide on plants. Its toxic effect limits the former use. In medicine arsenic is used as a tonic and it performs a similar office in various stock foods and medicines.

SULPHUR AND PYRITE INDUSTRY IN 1906.

The sulphur industry of the United States during the last few years has been characterized by steady growth in consumption, increase in production, and decrease in quantity and value of imports as a result of the development of domestic resources.

Statistics collected by Dr. David T. Day, of the United States Geological Survey, and published in an advance chapter from "Mineral Resources of the United States, Calendar Year 1906," show that the domestic production increased from 181,677 long tons, valued at $3,706,560 in 1905, to 294,153 long tons, valued at $5,096,678 in 1906. Exports amounted to 22,237 long tons, valued at $460,435.

The great production of sulphur in Louisiana continued in 1906, and the success of the Frasch sulphur process, by which the mineral is melted by streams of superheated water pumped into the Louisiana wells, has been fully demonstrated. Local demands for sulphur for sheep dip and for use in destroying vegetable parasites have been very well met by developments in Utah, Wyoming and Colorado.

The dominating factor in the world's supply of sulphur has been the production of the material in Sicily, which in 1906 showed a large decrease, chiefly due to the loss of the American trade through the development

of the Louisiana deposits. The exports from Sicily to the United States have decreased steadily for the last four years—from 155,996 long tons in 1903 to 41,283 tons in 1906.

The pyrite production of the United States increased from 253,000 long tons in 1905 to 261,422 long tons in 1906, but the price declined from an average of $3.71 per to nin 1905 to $3.56 in 1906, causing the total value to decrease from $938,492 in 1905 to $931,305 in 1906.

Pyrite burning entered significantly into the sulphuric acid business in 1882, when the product was 12,000 tons. In 1885 the product had increased fourfold; five years later it had nearly doubled again, and increase has since been rapid. The growth has been due not only to the cheapness of this source of sulphur but to the use of the cinder in the blast furnace. The dominant position in the pyrite supply is occupied by Virginia, and California and New York follow.

More careful attention to waste products in copper, lead and precious metal smelting will lead in the near future to a production of sulphuric acid in such quantities as to affect commercial conditions very appreciably, and these sources of the acid must be taken into account.

EXCHANGES.

The "Mining Journal," London, November 16th, touches editorially upon the evolution of the State Trust and applies its conclusions to the tin industry of the Federated Malay States. As the "Journal" points out, that industry is in the hands of small Chinese operators who are incapable of surviving the loss entailed by suspension until the market improves. "Trust must be fought by Trust, and if there were anything in the Malayan idea that the United States Steel Trust were still operating against the tin market, they could argue with some force that as the Administration had previously intervened to protect the country against the Trusts' smelting designs, consistency required that it should do so again against their bear operations. Meanwhile, the idea of State interference will become more familiar, and in proportion as financial experience and strength becomes more centred in a few hands, the demand for Government control or reprisal will certainly grow, and may even form the basis of the international struggle of the future."

The "Mining and Scientific Press," November 23rd, presents a paper on "Smelter Smoke, with a Discussion of Methods for Lessening its Injurious Effects," by L. S. Austin. This article we have pleasure in reprinting on another page and in discussing in our editorial department. Another article by Mark. R. Lamb on "Sliming Ore for Cyanidation" is timely. "It is not so certain from the present outlook that the sliming of all ore is generally advisable or even passible . . . However . . . it is possible, even easier, to treat and wash sand by agitation and vacuum-filtration than by leading. Sand cannot always be filtered successfully on vacuum-filters . . . Air-lift agitation has solved the problem of cheap and effective agitation of either sand or slime, but from the fact that fine grinding will increase extraction it does not follow that the entire mill product should be treated as slime. When it can be so treated such a plant is, of course, ideally small, self-contained, inexpensive, and easily operated.

PERSONAL AND GENERAL

Mr. M. L. Elliott, manager of the North Cobalt Silver Mining Company, left last week on a visit to England.

Mr. O. B. Perry, general manager in the Yukon for the Guggenhein Companies, has returned to New York for the winter.

Mr. S. Beanland, of the Boston-Richardson mines, Isaac's Harbor, N. S., has returned from visiting his home in England.

Mr. W. Knott, the discoverer of the Reddick mine at Larder Lake, died at Dorset, Ont., on the 21st ultimo, as the result of a gun accident.

Mr. O. S. James, consulting chemist for the J. E. Wilkinson Company and for the British American Smelters Limited, is conducting a series of experiments.

We learn, with regret, that Mr. Hiram W. Hixon, for many years past general manager of the Mond Nickel Company's mines and works, at Victoria Mines, Ont., is leaving Canada at the end of February next.

Mr. W. O. Gilman, operating an hydraulic mine in the Cariboo district, B. C., has returned to Boston, with the intention of arranging early in the spring for the equipment of the mine with suitable machinery.

Mr. D. W. Robb, president of the Robb Engineering Company, of Amherst, N. S., is at present in the West. After staying for a few days in Victoria he proceeded to San Francisco and other points in California.

Mr. Alex. McNeil, who has been actively associated with mining in Nova Scotia, as president of the Dominion Antimony Company and other enterprises, has left Halifax and will in future reside at Washington, D. C.

Mr. R. H. Sweetser, superintendent of the Algoma Steel Company's blast furnaces at Sault Ste. Marie, leaves shortly to assume the duties of superintendent of the Columbus Iron & Steel Company, Columbus, Ohio.

Mr. W. J. Prisk, until recently manager of the Dominion Antimony Company's mine at West Gore, N. S., is, according to the "Industrial Advocate" about to assume the direction of the Consolidated Gold Mines' property at Moose River.

Mr. E. A. Collins, of Hatten & Collins, consulting engineers of Webb City, Missouri, passed through Toronto on his was to Trenton, Ont., on the 7th December. Mr. Collins is a mining graduate of Queen's School of Mining.

It is reported from Vancouver that the Standard Oil interests have bonded a number of copper properties on Queen Charlotte Island, the claims having been recently examined and reported on by Mr. S. C. Chisholm, the company's chief engineer.

Mr. W. F. Jennings, of Sydney, C. B., has completed a tour of the mining districts of Nova Scotia, and is now engaged in preparing his report for the Mines Department at Ottawa on the mining and metallurgical industries of that province.

At the fifth semi-annual dinner of the Canadian Camp, held at Hotel Astor, New York, Dr. Robert Bell, chief geologist of the Ottawa Survey, was the guest of honor. Dr. Bell's entertainers were a group of men prominent in letters, finance and public affairs.

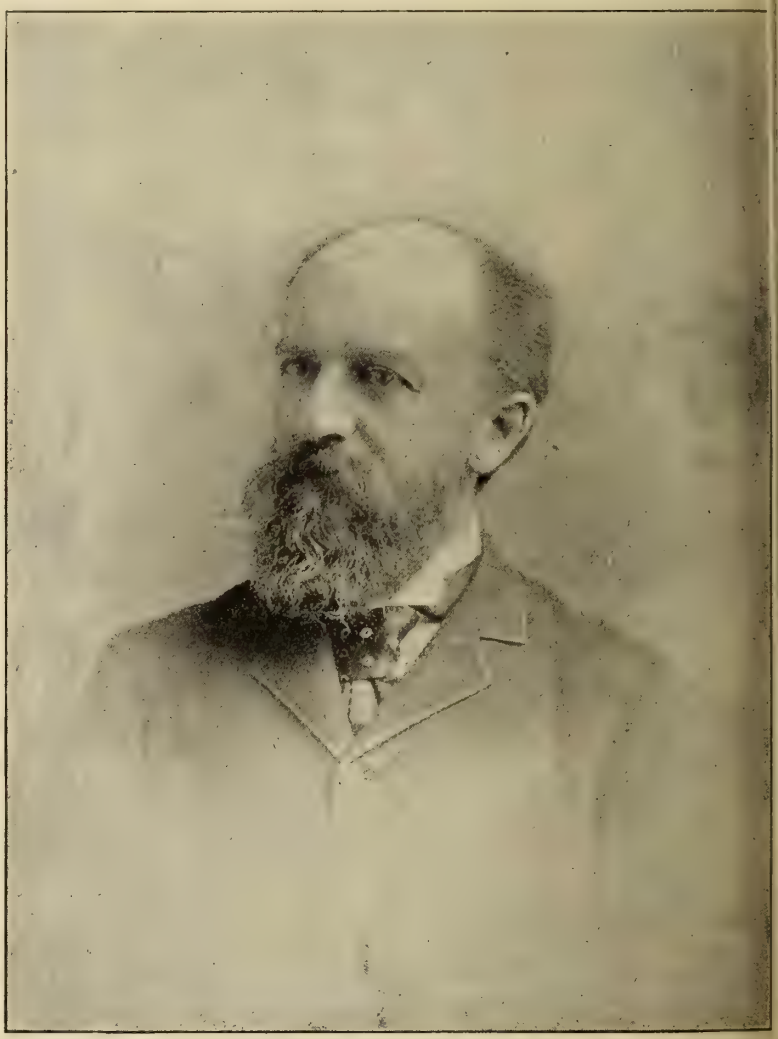
Mr. T. H. Wilson, chairman of the Tyee Copper Company, has arranged to go out to British Columbia and supervise the business of the company temporarily, pending the appointment of a successor to the late managing director, Mr. Clermont Livingston.

Mr. C. A. Molson, a Science Graduate of McGill University, and a Logan Gold Medallist, was accidentally shot and instantaneously killed near Salt Lake City, Utah, on November 24th. At the time of his death Mr. Molson was acting as engineer for the London Exploration Company.

Mr. E. P. Colley, a well known British Columbia land surveyor, has just returned to Victoria for a season's work in the Ootsa Lake country, where he was in charge of surveys for the Provincial Government. Mr. Colley speaks in very enthusiastic terms of the rich resources of this area.

Referring to the recent close down of the Granby mines and smelter in the Boundary District, Mr. J. P. Graves, managing director of the company, expressed the hope that the suspension of operations would be very temporary, but added that it was impossible for the company to produce copper at the present market price.

The nineteenth annual dinner of the students of the Faculty of Applied Science, of Toronto University, was held on December 6th. The guest of honor was President Falconer. Among the speakers were President Falconer, Dean Galbraith, Professor A. T. De Lury, Mr. T. W. Gibson, Acting-Dean Ellis and Mr. C. H. Rust. Nearly four hundred attended the function.



Mr. H. L. Clarke has ben appointed mechanical superintendent of the Dominion Coal Company's No. 1, 5 and 10 mines; while Mr. A. Stewart has been appointed to a similar post at Nos. 3, 4 and 6 collieries, and Mr. R. J. Bell for District No. 2. The appointments of Mr. John Maxwell to the management of Nos. 2 and 9 collieries, and Mr. B. Connors to No. 4 are also announced.

Mr. Louis Katona, a Hungarian metallurgist, commissioned by the Austrain Government to report on the mining industries in the leading countries of the world, is at present in British Columbia. In an interview he expressed himself as very favorably impressed with the mineral resources of Canada, but added, that he considered only the surface had to the present been scratched. He was especially interested in the electro-metallurgical experiments at Sault Ste. Marie, and stated that the copper smelters in the Boundary district were the most up-to-date plants he had seen, and that Canadian metallurgical practice was far in advance of that of Austria or Hungary.

The annual dinner of the Engineering Society of Queen's University, was held on the evening of December 6th, in Grand Hall, one of the magnificient new buildings of the University. The dinner was a success in every respect. The various students committees are deserving of much praise for the way in which all arrangements were carried out. Among the guests of the evening were Deputy-Minister M. J. Butler, Mr. J. B. Tyrrell, Mr. Frank Loring, Professors MacLeod and Porter from McGill, and Mr. J. C. Murray, editor of the Canadian Mining Journal. In addition to these gentlemen there were representatives from the University of Toronto, from McGill and from the Royal Military College. An innovation was introduced in respect to the hour of beginning. The guests were all invited for 6.30 p.m. The annual dinner has been made a dignified and important occasion. The students themselves indulge in no unseemly manifestations of animal spirits. The whole tone of the dinner is one of dignity and good fellowship.

OBITUARY.

The death occurred on the 29th ultima, at Montreal, of Dr. Bernard J. Harrington, professor of mineralogy at McGill University. The late Dr. Harrington was born at St. Andrews, Que., in 1848. He entered McGill as an undergraduate in 1865 and four years later graduated with first class honors in Natural Science, winning also the Logan Gold Medal. He then went to Yale University to study chemistry, mineralogy and metallurgy, and there took his degree as Doctor of Philosophy. Dr. Harrington was appointed lecturer in chemistry and mining at McGill University in 1871, but resigning the post at the end of the year, for seven years acted as chemist and mineralogist to the Geological Survey of Canada. In 1883 he was appointed professor

of Mining and Chemistry at McGill University, a position he held to the time of his death. As a writer of scientific subjects, more particularly in the domain of Canadian mineralogy, Dr. Harrington was well known. During his long and useful career he also held offices in many technical organizations. For many years he was president of the Natural History Society of Montreal, and editor of "The Canadian Naturalist," now published under the title of "The Canadian Record of Science." In 1897, he acted as vice-president of the Chemistry Section of the British Association at Toronto. In addition to his academic degrees, Dr. Harrington was a Fellow of McGill University, of the Geological Society, and of the Royal Society of Canada, and of the American Chemical Society.

CORRESPONDENCE.

The Editor,

CANADIAN MINING JOURNAL, Toronto, Ont.

Sir,—Regarding my article, "A Method of Mine Surveying," in your issue of November 15th, please note the following corrections:—

Column IV line 10 should read "foresight read from vernier still using side telescope"

In Fig II. $\Delta 110 - \Delta 111$ and $\Delta 111 - \Delta 112$ should be joined

Column IV paragraph 5 should read "The slope distance from centre of telescope at $\Delta 111$ to $\Delta 112$ and vertical angle being measured, the horizontal distance D_1 is calculated and the small angle $\delta = \delta_1 = \tan^{-1}\frac{d}{D_1}$, whence the azimuth $\Delta 111 - \Delta 112$ becomes

$$\text{Azimuth } (\Delta 110 - \Delta 111) \mp \tan^{-1}\frac{d}{D} + \text{deflection} \pm \tan^{-1}\frac{d}{D_1}$$

where d = the perpendicular distance between telescopes, the upper or lower signs being used when telescope is respectively to right or left of observer.

Yours truly,

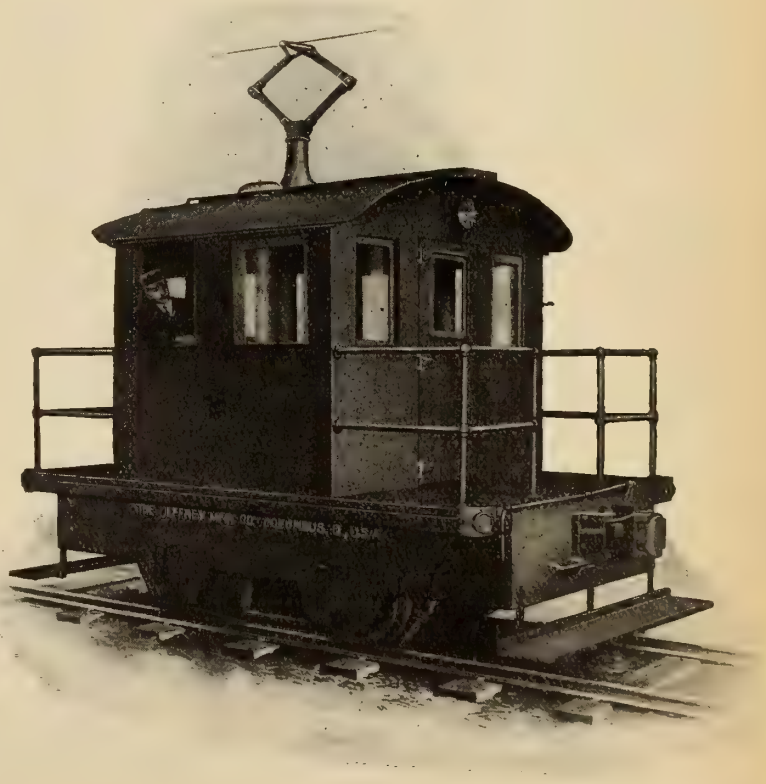
A. B.

Vancouver, B.C., Nov. 27th, 1907.

Springhill, N. S.,
Nov. 21, '07.

To Editor MINING JOURNAL,

Sir:—In a late JOURNAL there was a letter from Mr. Robert Archibald, manager of the Eastern Coal Company, at Maccan, criticizing some remarks of mine concerning the value of the coal claims outside of the C. Rw. & Company, holding in the county. It was not my object to at all discredit the value of the mines in operation in any part of the country. Outside of Springhill, Mr. Archibald probably knows more than the writer does about the value, or otherwise, of other mines operating in the country. I had not these in my mind when writing of the value of the C. Rw. & C. Company holdings. I have some knowledge of the well equipped and well managed Chignecto Mines, also of the value of the Joggins areas, and the splendid work being done there by the present management. I know of the efficient management of the Fundy, Kimberly, Strathcona and Jubilee mines, as the managers of these several mines are all my friends and acquaintances. Leaving the question then where Mr. Archibald has placed it, and which I had no thought of doing, I also leave that gentleman his assumption of comparative values of all the mines, in quantity and quality. I must admit, however, that judging from the costly surface-plant of the mine of the Eastern Coal Company, of which I had a glimpse, there must be coal seams of unquestioned value on this property.



Yours,

W. D. MATTHEWS.

NEW MACHINERY.

The accompanying illustration shows a view of a 25-ton switching locomotive built by the Jeffery Manufacturing Company, Columbus, Ohio, for use in handling freight cars for the Cerveceria Brewery, of Monteroy, Mexico. This style locomotive takes the same electrical equipment as the mine type, the only changes being in the side and end frames and the addition of a platform and suitable cab to accomodate the conditions incident to surface work. The motors are of the water proof steel frame type having drum wound armatures, laminated pole pieces, oil lubrication with auxiliary grease boxes and liberal wearing surfaces.

These locomotives are built in sizes from 10 to 30 tons with two motors, and in larger sizes with three and four motors, arranged with rigid frame or with double trucks having flexible wheel base, depending entirely on the conditions.

SPECIAL CORRESPONDENCE

NOVA SCOTIA.

GLACE BAY.—The output of the Dominion Coal Company's mines for November is in excess of any previous November in the history of the Company, being 336,190 tons compared with 308,365 tons last November and 303,000 tons in November 1905. On the 28th. the collieries raised 15,457 tons which is the largest single day's output this year with the exception of any day in June. On the 27th, No. 2 shaft raised 4,659 tons for one shift's work, and maintained an average of over 4,500 tons a day for three consecutive days. We consider this is a noteworthy performance.

Thanks to the excellent outputs the Coal Company were able to rush shipments to Montreal before the close of navigation and succeeded in sending up almost 100,000 tons in November, which is another record for this month, beating the figures of 1902, which were 92,000 tons. The Coal Company shipped remarkably late this year, the last ship leaving Sydney on the 28th. This is at least a week later than any previous final sailing. Thanks to the open season and the outputs the company were able to catch up very markedly on their Montreal contracts and the shortage in shipments will be much less than was anticipated.

The Hub Colliery commenced to draw coal again on the 27th November, after being idle about eleven months. Reserve and Caledonia will in all probability go on single shift this week, but there will be no slackness of work this winter. The winter outputs in Cape Breton are steadily climbing up to the summer production, and the marked disproportion that once used to exist between them is gradually disappearing. What little difference now exists is due to local climatic conditions and not altogether to a varying market.

The Coal Company took a census of their houses recently and some of the information obtained is of interest. Despite the large influx of population the Cape Breton miner numbers 85 per cent. of the total. The total population dwelling in the company's houses is a little over 10,500. There are possibly 2,000 of the company's employees who live in houses not owned by the company. Altogether the population dependent on the mines is at least 15,000, independently of the population of Sydney, which is less directly, but none the less surely dependent on the Glace Bay mines. An interesting figure in the census returns is that of 88 widows, nearly all of whom are allowed to live rent free by the Coal Company, and are allowed a certain amount of free coal.

Several new residents arrived recently in the shape of Poles from Scotland. It is rather amusing to hear these men talk, speaking as they do with the broadest Lowland accent. Finding their names a little unpronounceable some of these men have adopted Scottish names, such as Adam Nelson.

The population around the collieries is growing very cosmopolitan. On the tramcars that run from Glace Bay around the collieries to Sydney, one meets very varied types of passenger. It is no unusual matter to see Frenchmen, Indians, Greeks, Poles, Russians, Jews, Belgians, Hungarians, Germans, etc., on the same car, and one would need to be a very accomplished linguist to understand the babel of language that ranges from Gaelic to Micmac from Lithuanion and Magyar to the dialogue of the Lancashire and Yorkshire collier and his comrade from the "wee kingdom." But, eventually they all bow to the supremacy of the English language, and the next generation will retain no remnant of their mother tongue, but will speak English as it is spoken in Canada, with no variation in dialect, from Vancouver to Scaterie.

The three years contract between the Dominion Coal Company and the Provincial Workmen's Association as representing the workmen of the Coal Company will expire with this year. The Coal Company approached the officers of the P.W.A., at the beginning of November, with a view to the renewal of the contract, which has worked to the general satisfaction of all during the past three years, and at a meeting on the 20th of November the general manager of the Coal Company definitely offered the P.W.A. the option of a renewal of the old contract on exactly the same terms as before, the option to expire in one week. In putting their views before the men the Coal Company stated that while in the face of the present financial stringency and the prospects of industrial depression in the near future, there were many cogent reasons why it was not good policy on the company's part to enter into another long term contract at the present rate of wages, yet they felt these considerations were outweighed by the advantages of such a contract in giving general stability to their business, and in enabling them to make long term coal contracts and ship charters, added to the fact that it removed many possible factors of disagreement between the company and their men. For these reasons the company were willing to renew the contract as it stood. The general manager stated that in case the men were unwilling for any reason to renew the old contract, the company were willing to negotiate for a new one with the provision that it must not involve any increase in the cost of mining coal.

These proposals were reported to the Lodges, which we understand all decided definitely to refuse to renew the old contract. At a meeting held on the 27th November, the men asked for an increase of 15 per cent. to all day labor, an increase of about the same percentage to mechanics, that the loaders in all the Phalen seam mines receive a uniform rate of 15 cents per ton, which is an increase of from 25 per cent. to 30 per cent, and that all miners out of places receive $2.44 per day, when on shift work until such times as places are available.

The men claim that their earnings have been reduced by the introduction of safety lamps and by the use of high explosives and detonators, which have been introduced in many sections in place of compressed powder and squibs, and by the system of company's shotfirers. They state that the mines are over-crowded with skilled labor, and that the native miner is being unfairly displaced by importations of European miners. The scarcity of loaders is also working to their detriment. They point out that the cost of living is much higher than it was, and that with the present price of the necessities of life the wage of the laborer is quite insufficient. The P.W.A. express themselves further, as being opposed to any contracts, preferring to work without, as under these arrangements they are precluded from taking advantage of any marked increase in the selling price of coal, and they would prefer to have their wages regulated by a sliding scale, having the present scale of wages as the minimum basis.

The company state that they cannot consider any general increase to mechanics, who they consider are well paid. The majority of the mechanics employed by the Coal Company did not come within the range of the old contract.

The company state that they cannot consider the rate of $2.44 for miners out of places. Such a rule they consider would be impossible to carry out, and they could not guarantee to find work for any class of men.

The company recognize that $1.38 is a small wage, but they point out that the majority of men getting this wage are drivers, or old men past active labor and practically pensioners. Many others earning this wage are unfit for more arduous or responsible work, being physically or otherwise unfit. There are very few men at this wage who are supporting families.

With regard to loaders the company have for a long time had difficulty in getting enough of this class to work their mines to the best advantage, and agree that the wages should be increased in order to make the work more attractive.

The management of the Coal Company have accepted the decision of the men not to renew the old contract as a final answer. The men take the ground that as they do not wish to sign any contract, they had no further proposition to make.

For some time passed labor conditions have been unbalanced at the collieries, and the company's officials contend that this is very largely due to the great disproportion that exists in the remuneration paid for the different classes of underground work. They maintain that some classes are overpaid and that others are very much underpaid, and further, that considerable difference exists between rates at different mines on the same seam under similar conditions, for which there is no adequate or real justification. In the early part of the negotiations for the contract of 1904, the general manager of the Coal Company expressed himself as being favorable to a readjustment of rates, which would remedy this unbalanced state of wages, but was not successful in getting his plan adopted by the men.

Under the circumstances above detailed the management of the Coal Company have decided that the time has now arrived when in the interest of all concerned, such an adjustment should be made, and they have announced their intention to the men to put adjusted rates into force by the first of next year.

The company propose to make an increase in the wage of the loader, making the rate such that he will be able to earn $2.50 per day with a fair day's work. They further propose to equitably adjust the various mining rates in rooms worked by machines in such a way that the net result will be a slight increase in the total cost of mining machine room coal, and to increase the wages of the labor, excluding drivers and boys. To compensate for these increases it is intended to reduce the tonnage rate in pillars, which are claimed by the company to be so attractive that they cannot get men for the other necessary operations of mining. The management claim that the effect of a schedule such as they propose will be to benefit all concerned, that it will remove the unfair disproportion in rates which has resulted in an overlapping of their organization, that it will render it easier to get and retain the services of loaders, thus guaranteeing steady work to the more skilled and higher paid miners. The company also ask for the abolition or at least considerable modification of yardage consideration in pillars, and an understanding that whenever it is in the opinion of the management unsafe to draw pillars by the use of powder, the man will take these out with maul and wedge without powder at the same renumeration and without any cessation of work until such time as the dangerous conditions are overcome. The company also consider they should receive a fair return for the powder supplied by them to their workmen, which at present is charged at several cents below cost. In future powder will be charged at cost plus 10 per cent. to cover handling, distribution and wastage, the men being given the privilege of purchasing their powder elsewhere subject to its quality being approved by the officials.

At present all the company's employees get their house coal at a reduced rate. The company claim they lose heavily on this account every year, and that with the increase of the resident population the burden is steadily growing. They therefore propose to ask for a considerable increase in the price of workmen's coal.

The schedule of adjusted rates is to be presented for the consideration of the P.W.A. Lodges at their meetings on Saturday the 7th, and it is anticipated the men will give their answer early in the next week.

Up to the present the conference between the management and their men have been marked by fairness and courtesy, and the arguments of either side have been considered without any heat or ill-feeling. For a considerable time past the relations of the Coal Company's management with their workmen have been very pleasant, and it is hoped that they will continue to be so. The company are asking for a reply to their proposals by the 16th of December, and in any case, whether a contract is arranged or not, the new schedule of rates will become effective from the 1st or January 1908.

SPRINGHILL.—The workmen of Springhill have made application for a third Board of Conciliation. Ignoring the finding of the Board in the first place, they came out on strike for what the Board denied them. While out on strike, and certainly not employees of the company, another hearing was accorded them by the chairman of the second Board. There were no representatives of the company present. Copious evidence was given by the workmen in proof of the justness of their claim. But, after all the evidence was in, even the astute Judge who acted as chairman, was at a loss what to do with it as the men were on strike and the settlement of the strike would be the settlement of all questions between company and men. The list of grievances summed up in this latter reference simply makes all concerned look most ridiculous in the eye of the public. In view of their treatment of the first Board, the men should in decency hesitate before calling another. The Government and the public generally must be greatly exercised over the sort of Board these people want. One man prominent amongst them complained that the first Board was too much like a tribunal of justice, there was no opportunity given a man to say all he wished. Those of the management who do not look upon the whole proceeding with contempt are amused over the situation as developed by the strike.

Weigh scales were placed in position during the strike, and the company have since been weighing all coal taken from the mine. No definite arrangement has yet been made as to the price per ton, but this will be easy of adjustment now.

It is announced that certain capitalists are negotiating for the purchase of the C. R. & C. Co's areas in C. B. Whether this be true or not, it is a well known fact that these areas ar the most valuable, unworked on the Island to-day, covering as they do all the seams of the Morien Basin, situated to the south of the Dominion coalfields and midway between the splendid shipping ports of Sydney and Port Morien.

NEW BRUNSWICK.

New Brunswick is proving richer in minerals than many people ever dreamed of. Magnetic iron ore at Lepreaux, a mountain of iron at Gloucester, copper at Letete, with here and there a promise of richer finds, have served to direct public attention to the mineral possibilities of the province.

Premier Robinson, who was in St. John recently, expressed the opinion that the smelter to be erected by the Drummond Mines Limited, for working the Gloucester ore, would be located at Bathurst. According to expert reports made on this property, the mineral formation in that section is remarkable and is unique in the history of mining in Canada. The property is some fifteen miles from Bathurst on the Nepisiquit River and within a few miles of Grand Falls. It is an outcrop of what promises to be a large seam. The ore can be uncovered on the side of the mountain and without the sinking of any expensive shafts.

The property is located at some distance from the more frequented districts and for this reason the existence of the deposit was unknown to many except interested parties. In consequence of this, two or three private parties were enabled to secure control of all the property they desired. The fact that mining can be carried on as in quarries, and without the immediate necessity for the sinking of expensive shafts and the construction of hoisting plants, will greatly cheapen the work and practically the only undertaking of importance in connection with the development will be a railway line of fifteen miles in length from the working to Bathurst. It is estimated that the Nepisiquit River is capable of supplying 10,000 horse-power, which will be much more than can be required in the mines.

Mr. J. J. Drummond, of Londonderry, N. S., was in St. John on Friday, November 29th, and, after a brief stay in the city went to Gloucester County to look over the iron deposits. He expressed his intention of conferring with Premier Robinson and T. M. Burns, of Bathurst.

The most remarkable thing about the deposit, in Mr. Drummond's mind, was the fact that it had not been discovered for

such a length of time. He considered New Brunswick to be practically unexplored, as far as its mineral wealth was concerned.

The exploiting of the iron deposits will be carried on during the winter.

Next summer the Government will begin the construction of the branch railway from Bathurst.

At a meeting of the New Brunswick Iron Company held on Saturday, November 30th, a resolution was passed authorizing the sale of 2,000 shares of stock at $25 each. This was the only thing done. Cash from the stock sold will be used for development purposes.

Information from Campbellton is to the effect that a rich gold discovery on the Jacquet River had been made recently.

It was stated that the Archibald brothers, who have been prospecting on the river all summer came upon a rich find on Saturday, November 25th. A confirmation of the report has not been obtained at St. John up to the present time.

It has also been learned that the mine owned by Dalhousie and Campbellton parties on the southwest branch of the Upsalquitch is turning out well. The ore is assaying about $50 to the ton. Workmen have now tunnelled about fourteen feet. When forty or fifty in they expect to strike the ore shoot.

BRITISH COLUMBIA.

FERNIE.—The output of coal from the Crow's Nest Pass Coal Company's collieries is steadily increasing, and it is estimated that before the end of the year, a million tons will have been been mined for the year.

There is at present another coke shortage, due this time to the fact that the smelters are not in a position to take coke, and the ovens at Michel and Fernie have been operating about half time for a month past. The Boards of Trade have not been conspicuous in a noisy effort to handle the situation, as they were three months ago. They are not now asking the Government to force the Smelters to take coke, so as to keep the laboring men employed, and the mines and ovens of the Coal Company working to produce coke, as they were in the summer asking the Government to give the smelters coke.

It will be remembered that in June last the smelters of British Columbia raised wages 50 cents a day inside and out, and in this way created a market for labor which left the Crow's Nest Pass Coal Company without men at their ovens, so that they could not produce coke. Copper was then 25 cents. Copper is now 13 cents, and the smelters and miners of British Columbia find it impossible to mine and smelt and pay that wage, so that they have decided to close down. The result is that having created a shortage of coke in the summer, by their action in raising wages, they have now created another coke shortage, so far as coke makers are concerned. by being obliged to go back to where they were in May last.

If anything were wanted to show the unfairness and unbusinesslike action of the smelters last July, after creating a situation in trying to take advantage of it to injure the Crow's Nest Pass Coal Company, and bring the Government to veto the exportation of coke to the United States, it is the present situation. If their policy had been effective, during their present shutdown the whole plant of the Crow's Nest Pass Coal Company would have lain idle, to serve their selfish ends, and until they got ready to again do business, by undoing the mistake they made last June in raising wages.

THE KOOTENAYS.—The local situation has improved a little since last writing. This is due to the acceptance by the Rossland mine workers of the wage scale that was in force prior to the raise in wages of July 1st, and to the fact, that it is highly probable that the Granby mines will begin work on the sixth of December; at least it is the intention of the mine management to resume operation, provided the miners will go back to work at the same wage scale now prevalent in Rossland and other prominent mining camps. The miners of the St. Eugene mine at Moyie are more or less discontented at the moment of writing, owing to the fact that the Board that is arbitrating their differences in Nelson on the twenty-seventh of November, maintained that it was impossible and unreasonable to accede to the demands of the mine workers. It is anticipated that the Rossland mines will now be able to work along smoothly until general conditions are more favorable, and it is hoped that the Boundary people will get together and that work will be started there as expected on the sixth instant.

As stated above the thing that attracted most attention in Rossland camp during the last ten days, was the question as to whether an adjustment of the wage scale, which is a large item in this camp, could be arrived at. On Tuesday the twenty-sixth ultimo, Rossland Miners' Union took a referendum vote on the question, the mines closing down to afford all the men opportunity to cast their votes, and the result was that a very large majority favored retrograding to the scale of wages paid previous to July first. In view of this manifestation the rate mentioned went into effect on the first instant, and at the present time seems to be very satisfactory all around. It is stated that if the men had not voluntarily come forth and declared themselves as they did, some of the mines here might have been compelled to close down until the prices of metals strengthened. Under the high scale machine miners received $4.00 per day of eight hours and shovelers got $3.25. With the scale in force two or three months previous to July 1st, and which is again in effect, machine men are getting $3.50 for eight hours and shovelers $3.00; other help around the mines has been correspondingly reduced.

The men employed in the Consolidated Company's smelter, at Trail, B. C., voted on the 28th ultimo on the reduced wage scale, and as in the case of Rossland a majority were in favor of returning to the scale in vogue at the smelter prior to May 1st, at which time wages were advanced there. The question was examined from different view-points by both Unions and many factors entered into the result of the vote, which I cannot go into here, in this short article.

For the week ended November 30th, Le Roi mine shipped 2,240 tons of ore, Consolidated mines 3,635 tons. Le Roi Two shipped 525 tons of good grade ore. This is a fairly good output, and if maintained or increased in the future will bear good fruit. A good deal of important development work is being done on Le Roi, Centre Star, Giant-California and other mines here. So far the results of this development have been very satisfactory.

Mr. Kiddie has taken charge of the Northport smelter, vice A. I. Goodell who has taken charge of the Sullivan property at Marysville.

Ore received at the Trail smelter during the week ended November 30th, amounted to 5,373 tons. The following mines are shipping to Trail: Centre Star, St. Eugene, North Star, Silver King, Arlington, Whitewater Deep, Ferguson, Standard, Ymir and several others, shipments running from 458 tons, in the case of St. Eugene, 68 tons North Star, to 18 tons in the case of the Ymir, taking the mines in the order named.

Since last report the shareholders of the Consolidated Mining & Smelting Company, of Canada, have received their checks for the last dividend declared. The total amount of dividends paid so far by this combination amount to $848,825.00.

Things have been very quite in the Boundary for the last fortnight. All of the big mines and smelters are closed down tight. There are only about a baker's dozen of men working around the Granby, B. C. Copper and other mines. They are mostly retained as watchmen. At the Consolidated Company's, War Eagle property in the Boundary, over 500 tons of coal have been stored away to be used until electrical power is available. The B. C.

Copper Company is installing a huge 42 x 43 Jenckes Crusher, and has an up-to-date Rand rope driven compressor on order.

Nothing has yet been given out as to the conclusions arrived at by Messrs. Melville and Johnson of the Dominion Copper Company, after their visit to the mines of the company in the Boundary district. A lot will depend upon the action of the Boundary miners. It is stated that the mine operators have gained some concessions in the way of reduced cost for supplies, and if the miners are anxious to see the mines start up at an early date and are willing to give their little aid, the low grads propositions of the Boundary will be able to work along even with copper at its present low price for a while.

For the week ended November 17th, ore shipments from the Granby, Snowshoe, Mother Lode and Emma mines, amounted to 28,403 tons. These were the only mines shipping that week.

The directors of the Granby Company have deferrerd action on the regular quarterly dividend. The B. C. Copper Company have done the same thing, and it is not known whether the dividend will be paid or not. The last B. C. Copper dividend was 25 cents per share, regular quarterly with 15 cents extra and was paid September 4th.

There are now fifteen blast furnaces cold in the Boundary district, the B. C. Copper Company having blown out their last furnace on November 26th.

The balance of the machinery for the Crescent mine has finally arrived after a long delay, and Supt. Feeney has started work on the property with a force of ten men. They have recently made a strike of silver bearing ore on the Crescent running about $120.00 per ton.

R. Robert of the Jewel mine has gone to Ottawa on business. There are twelve men now working on the property. They have about 2,000 tons of ore on the dump and the ore body continues from two to four feet in thickness. As soon as the snow covered roads are in good condition for heavy hauling, some of this ore will be shipped to the smelter.

The lessee of the old Cariboo-McKinley mine have suspended operations for a while. It is said that the Providence mine will shortly resume work. The Strathmore, Fremont and E. P. U. mines are working steadily. The decline in the price of copper has not affected these high-grade silver properties the way it has the copper propositions.

There are a large number of men out of employment in the Boundary. In addition to the mining men who are idle, there are about seventy-five Hindus out of work, now that the farm products have been harvested. Unless these Hindus find work the Boundary people will have a small Hindu problem on their hands this winter. Numbers of the mine workers have gone into the hills doing assessment and development work and quite a number of them have gone into the woods cutting ties, getting out cord-wood, etc.

Only about 100 men are now engaged in building the Great Northern branch between Keremeos and Hedley. It is expected that the road will be to Hedley by May next and into Princeton about the end of 1908. The Vermillion Forks M. & D. Company will install machinery some time next year, which will enable them to augment their output greatly. The coal of this vicinity is well adapted to domestic purposes and there seems to be plenty of it. A strike has been recently made on Bear Creek and at Collins Gulch the seam recently discovered measures eight feet. The platinum properties being worked on Champion Creek in the Similkameen are showing up well, where work is being done.

The Guggenheims have suspended work indefinitely on their property in the Cariboo country. It is stated that they are negotiating for a group of valuable claims near the well known Britannia group.

The Britannia mine is now closed down tight, no one being about the place but a watchman. As soon as the ore about the Crofton smelter is cleaned up this plant will also shut down.

The Cornell group on Texada Island has been sold to the Texada Consolidated Mines for a half a million dollars. The Gold Peak group of claims on Moresby Island has been bonded to Tretheway Bros. for $10,000.00. The Queen Charlotte Islands are very rich in coal, petroleum, gold, copper, silver and timber, and their resources will add materially to the future wealth of the already richly endowed provinces of British Columbia, as soon as they are opened up on a greater extent.

Nelson people have also bonded and are developing valuable Moresby Island copper properties.

The Western Fuel Company, of Nanaimo, has come to an agreement with their employees in the matter of wages, etc. The new agreement makes permanent the 10 per cent bonus recently granted. The Nanaimo mines are now enjoying the largest output they have known in their history.

The Tyee smelter has not been materially affected by the slump in copper and is still in operation. They are treating a high grade ore from a mine on Prince of Wales Island, which with the output of the Tyee and other custom ores is keeping them quite busy.

Another pulp mill proposition is being advanced on the Coast for a plant on Howe Eound. We trust that it will get on a little farther than the plans and specification stage and that the promoters, who are Vancouver people, will get the industry going in eight months, as they anticipate.

The Canadian Zinc Company, of Nelson, have their new electrical process zinc extractor nearing completion. A Nelson syndicate has just recently put up $10,000.00 to complete the plant. The proposition has been about four years under construction and has cost from sixty to seventy thousand dollars. Zinc ores from the Slocan and other zinc districts will be treated along lines familar to miners in Sweden. If this separator is entirely successful many of the Slocan mines now inoperative where the silver values are low and zinc percentage are high, can be worked at a good profit.

The 5,600 foot aerial tramway for the Hewitt mine was shipped from Nelson, where it was assembled and where part of it was manufactured, a day or so ago. The Hewitt people have just purchased 1,000 acres of land surrounding their property near Silverton. They have acquired this for the dual purpose of insuring themselves of a reliable source of timber for the future, and over which to run their tramway from the Hewitt number six level to the mill recently acquired from the Wakefield mines. They are negotiating for a compressed air plant and other machinery and it looks as though they meant business.. In sympathy with a similar move in other parts of this district wages in the Slocan have come down a little. The Porto Rico mine has been leased to a Spogane man and a force of six men put to work. Poplar Creek, the gold camp, seems to be coming into favor a little again. Considerable work is being done and some good strikes reported. Forty-five men are being employed at the Rambler-Cariboo mine. Capt. Tretheway has resigned from the managership of La Plata mine, on account of his health. He is leaving B. C. for the East. Mr. Tretheway will still remain a director of the company.

The Government has been asked for grants to aid in opening the upper Duncan country, which is rich in mineral and timber wealth. One of the companies operating in that section is termed the Consolidated Mining & Smelting Company, of British Columbia. This must not at all be confused with the Consolidated Mining & Smelting Company, of Canada, which is the Rossland concern.

The Sullivan Company at Marysville has just completed the installation of a third Huntington-Heberlein Roaster. It is the idea, however, of the Sullivan Company, to further explore the mines at Kimberly, at depth, before making any further addition to the smelter. As mentioned above in this report A. I. Goodell is now in charge at Marysville.

The St. Eugene arbitration board sat in Nelson on the 29th ulto. The men based their application for higher wages on the higher price of metals and higher cost of living. The company urged that there had been no material increase in the cost of living and that the high prices for metals no longer existed; further, that the St. Eugene miners were getting higher wages than those in Rossland, Butte and elsewhere. Next sitting of the Board will be held at Nelson December 19th, in the meantime there will be a conference held at Moyie.

The Aurora properties across the lake from the St. Eugene and in line with the submarine mine on the lake have been bonded by Moyie people. About $10,000,00 has been expended on development work up to dote.

Labor is now plentiful along the Crow's Nest Pass, but there is a shortage of coal cars. The Crow's Nest Pass Company pay-roll for October was $205,416. The provincial mineralogist has been investigating a huge crack in the mountain near Coal Creek. The miners feared a repetition of the Frank disaster. No danger is feared for the settlement of Coal Creek from this break in the hillside, however, as the conditions are not the same as existed at Frank.

Dec. 4th, 1907.

GENERAL MINING NEWS

NOVA SCOTIA.

PORT MORIEN.—The new North Atlantic Collieries, who have acquired the properties of the Gowrie and Blockhouse Collieries, Limited, are making especial provisions for sailing vessels and schooners, whereby they may be loaded with coal with a minimum of delay. Port Morien harbor, being safe, easy of access, and open for the major part of the year, offers inducements not to be obtained at more northerly sea-ports. The run of mine product averages less than 1.00 per cent sulphur and 2.50 ash.

SYDNEY.—The Dominion Coal Company is to ship through Portland, Maine, this winter 195,000 tons of coal, 130,00 tons will be transhipped through Canada and 65,000 tons will be used on the Grand Trunk.

It is reported that the Dominion Coal Company is to import 1,000 Polish and Slav miners between now and May 1st 1908. The men are to be chosen from those familiar with Scotch methods of mining.

SYDNEY MINES.—The Noca Scotia Steel & Coal Company's collieries had an output twelve hundred tons larger during November than during the preceding month.

The figures are as follows:—

Mine.	Tons.
No. 1.....	24,031
No. 2.....	26,387
No. 4.....	488
No. 5.....	7,374
Total	58,280

November output was exceptionally good since No. 4 was unable to ship coal on account of some unavoidable delays in construction work. Water is being rapidly taken out of the old No. 2 colliery.

Activity prevails in the othher departments of the company's works.

QUEBEC.

MONTREAL.—Dr. B. W. Harrington, Professor of Chemistry, McGill University died on November 29th. Dr. Harrington had been one of the leading figures in his profession for many years.

ONTARIO.

OTTAWA.—The appointment of R. W. Brock, Professor of Geology at the Kingston School of Mining, to the position of Acting-Deputy Minister and Director of the Geological Survey was announced on November 29th.

COBALT.—George Leyson, formerly manager of the Silver Queen, has been placed in charge of the Cobalt Central.

The Cobalt Central Concentrators are now treating over 80 tons of ore per day.

The T. and H. B. mine, it is reported, is to be sold at a satisfactory figure to an English syndicate.

The Silver Bar has suspended mining operations pending the installation of a large new compressor plant.

At the end of November the Tretheway No. 2 shaft was down 85 feet. High grade ore is being shipped from Tretheway to Copper Cliff.

The Cobalt Concentrators, Limited, will conduct a custom sampling business at their Nipissing plant. They will sample only high-grade ore.

Winter roads are to be constructed from the T. & N. O. line to Montreal River district. Contracts have been let already for 37 miles.

The boilers for the new 18-drill compressor of the Nova Scotia mine have been installed.

At the McKinley-Darragh mine the stamp-mill is to be increased to 30 head of stamps.

Experimental shipments of Cobalt ores are being made to Great Britain and Germany. Old country smelters are becoming much interested in the camp.

The King Edward mine has discharged eighty of its men. Only forty are now employed.

The Right of Way will soon ship two cars of high-grade ore. A third quarterly dividend of seven per cent. will result from this shipment.

COPPER CLIFF.—Five cars of Cobalt ore arrived at the smelter on December 2nd. Nine more are on the road.

ALBERTA.

LUNDBRECK.—The Galbraith Coal Company of this place hoisted coal over the new plant for the first time, early in December. The plant cost $25,000. 100 tons of coal will be hoisted daily.

SASKATCHEWAN

REGINA.—The Saskatchewan Government has acquired from the Federal Government coal areas in the district of Eagle Lake. Arrangements are being carried through by which the Povincial Government will be able to mine and sell coal to settlers, before next April. The Grand Trunk Pacific Railway will pass through the district.

BRITISH COLUMBIA.

VANCOUVER.—The discovery of important seams of bituminous coal is reported 100 miles northwest of Barkerville on the projected main line of the Grand Trunk Pacific. These are the first coal lands discovered in northern Cariboo. Their economic importance is indisputable. The nearest coal lands are three hundred miles west in the Telgna district.

The re-opening of the mines and smelters of the Granby Consolidated was announced by General Manager J. P. Graves, on December 2nd. The men have agreed to accept the scale of wages in force twelve months ago. Output will be increased and plants extended immediately.

The Britannia mines on Howe Sound are closed down indefinitely. It is understood that the shut-down was caused by the owners' loss of money on the New York stock markets.

GRAND FORKS.—A large amount of coke has accumulated at the Granby smelter.

BORMDARY.—Work has started on the Crescent mine. Drifting is being done at the 300-foot level.

ROSSLAND.—The Rossland Miners' Union by referendum vote on November 26th, decided to accept the wage scale that obtained before July 1st. Instead of $4 and $3.75, machine men and shovellers will now receive $3.50 and $2.75 respectively. The resolution was carried by two thirds majority.

MINING NEWS OF THE WORLD.

GREAT BRITAIN.

Great Britain's production of tin last year was 6,698 1-2 tons, of which the Cornwall mines contributed practically the whole, namel 6,690 tons. The high price of tin in 1906, resulted in the re-opening of old mines and thus the year's output shows an increase. Notwithstanding Great Britain as a tin producing country, ranks very low compared for example, with the Federated Malay States, which last year produced nearly 55,000 tons, and of Bolivia, which exported 19,425 tons of metallic tin. Australia with 5,400 tons and China with 4,538 tons are not very far short of British production.

The Miners' Federation of Great Britain have recently decided that an attempt shall be made in all the coalfields of the United Kingdom to merge the present minimum percentage of wage into the existing standard, which would mean a material advantage to them; and the South Wales colliers have already taken steps in this direction. The owners' representatives refused, however, to discuss the question, since they claim it is entirely outside the present agreement, and in any case could not be dealt with until that agreement expires, two years hence.

According to "The Phoenix" magazine published by the Royal School of Mines, all records in shaft sinking have been broken by the Brakjan Mines Company, managed by one of the associates of the School. In the No. 1 shaft of this mine, sinking averaged 143 feet during six months, and more recently 161 feet during three months. The shaft is of the seven compartment type, and is 8 feet wide by 39 feet long.

BELGIUM.

The official returns of this country's mineral production during 1906 have just been made public. The chief industry is coal mining, the production of coal having been 23,569,860 tons, while the industry employed 139,394 persons. Belgium's metal mining interests are small, but the returns show that 3,858 tons of blende, 908 tons of pyrites, 55,950 tons of iron and small quantities of manganese and lead were won. There are, however, very considerable metallurgical undertakings in the country, including thirteen zinc smelters, besides lead and steel works, employing in all over forty thousand persons.

RUSSIA.

Since the beginning of the year the price of platium has dropped nearly one third, which according to an official report from Russia is attributable to the fact that a great quantity of old platinum has been thrown on the market.

The gold deposits in the North Ural are said to be extraordinarily rich, although they are not being worked to any great extent. This is explained by the "Ural" on the ground that the district is very inaccessible, and that capital seemingly prefers to engage in quartz mining undertakings. Several years ago the Russian Mining Department commissioned an engineer to prospect these areas, his results and reports being eminently favorable.

UNITED STATES.

The statement of the United Steel Corporation for the quarter ending September 30th, shows a gain in net earnings as compared with the crroesponding period of last year of over five million dollars, while the aggregate earnings reached the enormous sum of $43,804,285.

The report of the State Mineralogist of California places the total value of the mineral productions of that State during the last year at $46,776,085, as compared with $43,069,227 in 1905. Of this the production of metallic substances, including precious minerals, represented a value of $26,156,702; of non-metallic substances, $2,589,984; of hydrocarbons and gases, $10,170,273; and of structural materials, $7,859,126. The principal minerals of the State are first, gold, the value of which produced in 1906 was $18,732,452; second, petroleum; third, copper; fourth, clays and their products; fifth, cement; sixth, borax and seventh, silver. It is also to be noted that California produced last year a small quantity of asbestos, the value of which was $3,500.

Imports of mica into the United States last month from Canada and India principally were 572,215 pounds valued at $242,176.

At the recent meeting of the American Mining Congress at Joplin, Mo. a resolution was passed substituting that passed at last year's session, in favor of the establishment of a Federal Department of Mines. The new resolution advocates the creation of a Bureau of Mines and Engineering Investigation, under the Department of the Interior to: (1) Investigate and inquire into the nature and extent of the mine and quarry industries of the United States; (2) investigate in foreign countries concerning methods of mining, etc.; (3) investigation of, and enquiries into the engineering problems of the Government, and the testing of materials belonging to or for the use of Government; (4) to cooperate with the Geological Survey in determining the value of mineral products; (5) to publish and proptly distribute information so obtained.

The American Smelting & Refining Company has issued a circular announcing a change in methods of quoting prices on lead. The circular states the practice in the past has been to adhere to a fixed schedule for pig-lead, and to only change this schedule at rare intervals; but that henceforward prices will be fixed according to market conditions.

What is said to be the biggest and most remarkable coal mine in the world is known as Vesta No. 4, at California, Pa. During the first month of the mine's existence it produced 174,338 tons of coal, maintaining a daily output of from six to seven thousand

tons. In the mine are 600 rooms and 85 miles of stationary railway track, over which twenty-eight electric locomotives draw the coal to the surface. Steel 3-ton trams are used, one hundred going to a train. When the mine was opened two months ago, the tracks were equipped with 60-pound rails, but these proving too light, they have since been replaced with 90-pound rails. It is the intention to continue production at the rate of 175,000 tons monthly, and there is said to be sufficient coal in sight to keep the mine working for sixty years.

A coal-damp explosion at the Naomi mine, Fayette City, Pa., on December 1st, caused the death of thirty miners. The explosion was so terrific that the air-system was completely wrecked. The probable cause of the accident was the use of an open lamp in an old working. The Naomi mine is one of the largest bitimiuous mines in the district. It is owned by the United Coal Company, of Pittsburg, and gave work to 250 men.

VIRIGINIA.—Monangah mines Nos. 6 and 8 of the fairmount Coal Company, subsidary to the Consolidation Coal Company, of Baltimore, were the scenes of the horrible catastrophe of December 6th. Every effort has been put forth to rescue the 350 miners entombed by the terrible explosion of "black damp." Altogether 85 bodies have been brought to the surface. Heart-rendering scenes are witnessed daily at the pit-mouth.

COLOMBIA.

Many important discoveries of platinum are reported to have been made recently in the province of Lloro, but seemingly the Government intends to reserve the areas, as applications for mining rights have been refused. The Colombian Congress not long ago since passed a disposition constituting platinum a Government monopoly.

MEXICO.

The export metals from the Mexican Republic during the year 1906-07 was valued at $160,246,002, of which the exports of silver were $99,861,790; gold, $23,873,713 and copper, $28,018, 693.

AUSTRALIA.

Mine owners generally in Australia are complaining of the increased cost occasioned by the Federal tariff on the working of their mines, and recently a deputation waited on the Government to point out the unreasonable character of many of the new duties. They were assured, however, that a high protection would continue to be maintained on machinery which, with this assistance, Australian manufacturers were capable of producing.

The State Government of New South Wales has appointed a Commission to enquire into the question of electricity in coal mines. The board will be required to decide, whether the use of electricity in gaseous mines is attended with danger. The contention of the miners is that compressed air alone should be employed in gaseous mines, and electricity in mines where no gas has been found.

An official report upon a discovery of asbestos in the Pilbarra district, Western Australia, states that the property is situated in a very rough country, 15 miles west of Cooglegong. The asbestos occcurs in the serpentine belt running northeast and southwest, and mounded by 1 large jasper dykes. The sepentine varies in width from about 5 to 20 chains. Very little prospecting work has been done, however, and the value of the discovery is therefore quite problematical.

New iron and stel works were recently established at Lithgow, New South Wales, and production is now being made at the rate of 700 tons a day.

NEW ZEALAND.

The gold production of New Zealand last month was 26,167 ounces valued at £102,691, or considerably less than one half the yield for October, 1906.

SOUTH AFRICA.

The Government of the Transvaal has decided to operate a gold mine as a training school for miners, which remaks the correspondent of the "London Mining Journal," has met with very general approval. Considering the large number of white laborers, who are anxious to secure a training as mine workers, the step should result in advantages all round.

Costs at a number of the mines on the Rand have been considerably increased by the repatriation of Chinese miners. Thus at a recent meeting of the Glen Deep Company, the chairman, that in consequence of the necessity of replacing Chinese by native workers, the monthly profit of the Glen Deep, which during the past financial year averaged £10,000 fell to £7,423 in August and to £2,751 in September. The working costs in August had risen to 23s. 8d., and in September to 26s. 1d., as compared with an average of 21s. per ton for the year ending September, 1906.

STATISTICS AND RETURNS.

COBALT ORE STATEMENT.

For the week November 16th to 23rd:—

La Rose Mine, to Denver Col.—Nov. 18th, 66,000; Nov. 18th, 41,210; Nov. 19th., 41,335; Nov. 19th, 54,000; Nov. 19th, 66,000; Nov. 19th, 44,000; Nov. 20th, 66,000; Nov. 20th, 44,000; Nov. 20th, 66,000; Nov. 21st, 66,000; Nov. 21st, 66,000; Nov. 21st, 66,000; Nov| 22nd, 44,000; Nov. 22nd, 44,000; Nov. 23rd, 66,000; Nov. 23rd, 66,000; Nov. 23rd, 44,000; Nov. 23rd, 44,000; total, 994,545.

Temiskaming Mining Company, to American Smelting & Refining Company, Perth Amboy—Nov. 22nd, 63,000.

Totals—1,057,545.

Dominion Coal sales for November show an increase. November, 1907, 335,811 tons; November, 1906, 308,367 tons; November, 1905, 303,440 tons.

Following are the weekly shipments from Cobalt camp, and those from January 1 to-date.

	Week ending Nov. 30. Ore in lbs.	Since Jan.1. Ore in lbs.
Foster	95,500	611,806
Hudson Bay	134,000	179,170
Kerr Lake (Jacobs)	44,000	539,770
La Rose	1265,000	5,491,545
Nova Scotia	92,230	248,230
Silver Queen	120,000	957,157
Trethewey	53,750	1,648,438
Townsite	42,200	234,278
Temiskaming	63,000	355,011

The total shipments for the week were 1,912,680 pounds, or 956 tons. The total shipments since January 1, 1907, are now 25,905,-811 pounds, or 12,997 tons.

RAND GOLD OUTPUT.

Gold production of the Rand during November is estimated at 545,000 fine ounces, against 553,553 fine ounces in October, and 583,373 fine ounces in November last year. The value of the November output, calculated on the basis of the above estimate, compares as follows with preceeding months and years:—

November, 1907	$11,581,000
October, 1907	11,757,000
September, 1907	11,527,000
August, 1907	11,788,000
July, 1907	11,314,000
November, 1906	11,328,000
November, 1905	9,021,000
November, 1904	7,139,000
November, 1903	5,932,000
November, 1902	3,979,000

The output of the Dominion Coal Company's collieries in November was, roughly, 336,000 tons, as compared with 308,367 tons in November, 1906, and 342,469 in October, 1907. Comparative figures follow:—

	1907.	1906.	1905.
January	252,248	231,606	160,612
February	226,190	225,716	128,778
March	203,194	310,220	228,765
April	316,384	296,417	221,541
May	328,947	323,777	294,647
June	319,560	325,911	332,926
July	314,559	318,291	329,164
August	316,633	327,734	329,172
September	295,058	323,733	322,288
October	342,469	350,009	333,317
November	336,000	308,367	303,440
December	.....	206,884	211,877
Totals	.....	3,248,565	3,196,527

COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp, and those from January 1 to date:—

	Week ending Dec. 7 Ore in lbs.	Since Jan. 1. Ore in lbs.
Buffalo	160,000	2,298,820
City of Cobalt	.....	101,230
Coniagas	175,800	4,798,710
Cobalt Central	.....	101,360
Colonial	.....	74,250
Drummond	.....	108,920
Foster	.....	611,806
Green-Meehan	.....	196,780
Hudson Bay	.....	179,170
Imperial Cobalt	.....	37,530
Kerr Lake	.....	539,770
La Rose	171,600	5,663,145
McKinley Darragh	253,050	1,265,565
Nipissing	.....	4,468,000
Nova Scotia	.....	248,230
O'Brien	60,780	2,666,360
Red Rock	.....	91,443
Right of Way	.....	134,530
Silver Leaf	50,100	93,618
Trethewey	.....	1,648,438
Townsite	.....	234,278
Temiskaming	45,600	400,611
University	.....	61,383

The total shipments for the week were 917 pounds, or 458 tons. The total shipments since January 1, 1907, are now 26,912,831 pounds, or 13,456 tons. In 1904 the camp produced 158 tons, valued at $136,217; in 1905, 2144 tons, valued at $1,473,196; in 1906, 5129 tons, valued at $3,900,000.

The output of the Crow's Nest Pass collieries for the week ending November 29th was 21,820 tons, a daily average of 3,637 tons. For the same week last year the figures stood 13,736 and 2,289 tons.

The output of the Crow's Nest collieries for the week ending December 6 was 23,212 tons, a daily average of 3,869 tons.

British Columbia ore shipments for week ending November 30th stand as follows:—

Boundary shipments—Week, 19; year, 1,141,000.

Rossland shipments—Week, 7,038; year, 256,380.

Slocan-Kootenay shipments—Week, 3,705; year, 160,419.

The total shipments from the mines in the above districts for the past week were 10,762 tons, and for the year to date 1,557,799 tons.

Trail smelter receipts—Week, 5,373; year, 242,622.

Le Roie smelter receipts—Week, 2,862; year, 91,386.

Marysville smelter receipts—Weew, 600; year, 28,800.

The total amount of recepts reported from the olcal and foreign mines for the past week were 8,835 tons, and for the year to date 1,427,887 tons.

Shipments from the collieries of the Cumberland Railway & Coal Company, Springhill, N.S., for November were 28,741 tons. No shipments were made during August, September and October, as men were on strike.

Company Notes.

NORTH STAR MINING COMPANY, LJMITED.

The directors have to report that during the summer diamond drilling has been carried on over a small extent of the company's property, until operations were stopped by weather conditions. Some of this work was encouraging, but no new large bodies of ore were discovered.

The mining operations during the last six months have been fairly satisfactory. Additional small bodies of ore have been found in the old workings, from which ore has been shipped at the rate of about 300 tons per month. The value of this ore has averaged about $14.00 per ton, after deducting freight and treatment charges, but not mining expenses. The company's manager reports that there is at present in sight about 1,500 tons, which will enable the company to continue shipping at the same rate during the winter months.

The directors have declared a cash distribution at the rate of two cents (2 cents) per share, and notice is hereby given that the transfer books of the company will be closed at noon, on Tuesday, the 10th December, and dividend will be paid to shareholders of record on the above date on the 20th December.

The annual meeting of the stockholders of Cobalt Central Mining Company will be held on December 20th.

The Calumet & Arizona Copper Company has declared a quarterly dividend of $1.50 per share. The dividends three months ago was $5 a share.

Calumet & Hecla has declared a quarterly dividend of $10 per share. This compares with $15 per share declared in September, $20 in May, $20 in February and $20 in November, 1906.

The first annual meeting of the Coniagas Mines, Limited, was held a tthe company's office, St. Catharines, on Saturday, November 30th, with a large representative number of the shareholders present.

Mr. R. W. Leonard, president, submitted the director's report for a period of eleven months, ending October 31, 1907, showing the result of mining operations for that period. A full report will be printed and ready for distribution to the shareholders in a few days.

The following is a correct abstract taken from it:—Gross returns, $779,285.13, less total working expenses, including cost of organization, freight and treatment, etc., $154,522.91; net returns, $624,762.22; dividends paid, 1 to 3, inclusive, $240,000; bonus paid, $40,000; dividend payable November 1, 1907, $80,000; total, $360,000; balance, $264,762.22.

In addition to the above there is ore stored in dump to be concentrated of an estimated value after allowing for concentrating and treatment charges of $100,00.

Since the close of the year the president explained that a shaft to reach a lower level had been sunk to a depth of 60 feet under th 75 foot level, and that the ore at that depth was equal to any so far encountered. In reply to a vote of confidence in the management, the president stated that the one aim of the management had been to make his mine a business man's proposition, and this policy would be carried out as long as the present management continued.

The Wile Power Gas Company, of Cleveland and New York, have removed their general offices from Cutter Buildings, Rochester, N.Y., to their works, 1688-92 Columbus road, Cleveland, Ohio, where all communications should henceforth be addressed.

The company formerly known as the J. R. Alsing Company has changed its name to the J. R. Alsing Engineering Company. Its capital stock has bee nincreased from $20,00 to $100,000. No charge has been made in the personnel of the management. The main office is at 136 Liberty street, New York.

The Deister Concentration Company, for whom C. B. Fitch is Canadian agent, have shipped four No. 2 Deister table to the Coniagas Mines, Cobalt, Ont.

The statement of the McKinley-Darragh Mine, issued on November 21st, shows total cash on hand to be $53,536. To this amount must be added approximately $120,000 due on ore shipped to the smelters. The following figures represent receipts and expenditures from the organization of the company until November 1st, 1907.

Receipts from sale of treasury stock	$162,304.92
Receipts from sale of ore	127,081.18
	$289,386.13
Disbursements—	
Savage mine—	
Debts	$ 6,244.88
Plant	14,550.90
Development and operations	18,399.90
McKinley-Darragh—	
Plant	36,667.25
Development and operating	90,135.86
General	24,404.73
Interest and discount	1,503.22
Office furniture	242.44
Dividend	44,150.96

The balance left on hand is $53,536.47.

Since July 10th, when a car load of ore netting $21,147.37 was sold, ten car loads, or 562,000 pounds, of ore have been shipped. Forty-nine thousand four hundred and eighty-three dollars and seventy-seven cents has been received in cash, and $125 remains due the mine for ore sold. On November 1st there were on hand at the mine of No. 1 ore 51,770 pounds; silver nuggets from the lake shore, 4,495 pounds; concentrates, 24,896 pounds; No. 2 ore, 141,485 pounds. The value of the above ore is estimated at $52,-000. Since July 7th, then, 934,400 pounds of ore have been produced, worth, roughly, $200,000.

The completion of the coffer dam across the south end of Cobalt Lake and the pumping out of the water rendered available not only nuggets but some second grade and milling ores. Altogether 4,500 pounds of nuggets; 100 tons of 300 ounce ore; and 1,500 tons of milling ore, 150 ounces to the ton, were won by the dam.

METAL, ORE AND MINERAL MARKET.

Aluminum, No. 1 grade ingots—37 to 40 cents per lb.
Antimony—7 3-4 to 10 cents per lb.
Arsenic, white—6 1-4 to 6 3-4 cents per lb.
Barytes, crude—$18 to $20 per short ton.
Bismuth, metal—$1.75 per lb.
Cadmium, metal—$1.50 per lb.
Carbons for drills—$70 to $90 per carat.
Carborundum, powdered—8 cents per lb.
Chromium, metal pure—80 cents per lb.
Cobalt, f.o.b. Cobalt, Ont., unrefined—30 to 40 cents per lb.
Corundum—7 to 10 cents per lb.
Feldspar, ground—$10 per short ton.
Flourspar, lump—$8 to $13 per long ton.
Graphite, domestic—$50 to $150 per ton.
Gypsum, lump—$7 per short ton.
Infusorial earth, ground—$15 to $30 per ton.
Manganese, pure metal—75 cents per lb.
Mica, ground—$40 to $70 per short ton.
Mica, scrap—$10 to $15 per short ton.
Molybdenum, pure—$1.70 per lb.
Molybdenite ore, 90 per cent. pure—$4.50 to $5 per unit.
Nickel, metal—45 cents per lb.
Platinum, ordinary metal$26 per ounce.
Platinum, scrap—$18 per ounce.
Pyrite—10 to 11 3-4 cents per unit for 38 to 45 per cent. sulphur, lump ore or fines.
Quicksilver—$45 per 75 lb. flask.
Sulphur—$10 to $21 per long ton.
Talc—$15 to $40 per short ton, crude.
Tungsten, pure metal—$1.20 per lb.
Tungsten ore, 60 per cent. pure—$9.50 per unit.

MARKET NOTES.

Silver, Nov. 21st, 58 1-2; Nov. 22nd, 58 3-8; Nov. 23rd, 58 3-4; Nov. 25th, 58 3-8; Nov. 26th, 57 7-8; Nov. 27th, 57 3-8; Nov. 29th, 57 3-4; Nov. 30th, 57 5-8; Dec. 2nd, 57 3-4; Dec. 3rd, 57 3-4; Dec. 4th, 57 7-8.

Dec. 4th, Mexican dollars, 46 1-2 cents; sterling exchange, $4.86.

Copper.—Both New York and London markets are weak, with a small volume of business reported. New York, lake 13 1-2; electrolytic, 13 1-4 on Dec. 4th; London, £60.

Spelter.—The market in spelter has gone to pieces. New York, 4.45 cents; London, £21.

Lead.—Market still weakening. Very little business. New York, 4.05 cents; London, £15 15s. for Spanish.

Tin.—Market weak. New York, 30 1-4 cents; London, £144 10s. for spot.

Pig Iron.—Pittsburg, Bessemer, $18 to $20. No. 2 foundry, $18.50.

SOUVENIR HAND BOOK

A.I.M.E. TOUR

THROUGH

COBALT, SUDBURY AND MOOSE MOUNTAIN

OWING to the extreme care necessary in handling the colour press work in printing this volume the publishers have been unable to bring it out as soon as was hoped. It is now ready.

Orders have been received for a large number. It is probable that a second edition will have to be printed. The publishers will consider it a favor if intending purchasers will send in their orders as promptly as possible. In this way the need of a second edition can be determined early.

ROOF RIGHT NOW

There is one roof that saves money because it will last 100 years. Guaranteed in writing for 25 years.

"OSHAWA" GALVANIZED STEEL SHINGLES

This roof saves you work because its so easy to put on (do it yourself with a hammer and snips), and save you worry because they fireproof, windproof and weather-proof the building they cover. Write us about it and hear all about 207 ROOFING RIGHT. Address

The PEDLAR People (Est'd 1861).

PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the anadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Wanted

Position as Manager, Superintendent or Assistant. 20 years practical experience as Consulting Engineer, South Africa, United States and Mexico, in underground mining, gold, silver, copper and pyrites mines and milling. Specialty, production at minimum cost. Expert bookkeeper and mine accountant.

Address "M. T." Canadian Mining Journal

Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron inlarge bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

HON. FRANK COCHRANE,
Minister of Lands, Forests and Mines,
Toronto, Canada.

BRITISH COLUMBIA

The Mineral Province of Canada

has produced to the end of 1906, $68,721,103 of Placer Gold; $41,015,697 of Lode Gold, $25,586,008 of Silver; $17,625,739 of Lead; $35,546,578 of Copper; $79,334,798 of Coal and Coke; and $5,813,799 of Other Minerals; or a total of **$273,643,722.** The Mineral Production of the Province for 1906 was

$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was $5,579,039 the Lead Output 52, 408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discovers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

CANADIAN PACIFIC RAILWAY CO'S
Empresses of the Atlantic
NEW EXPRESS STEAMERS—QUEBEC TO LIVERPOOL

EMPRESS OF IRELAND—EMPRESS OF BRITAIN

570 feet long **65½ feet broad** **14,500 tons**

RATES

1st class -	$80.00 to $500.00
2nd " - -	45.00 and 47.50
3rd " - - - -	28.75

SECOND CLASS

The 2nd class rooms on these steamships afford very superior accommodation. They are very large and airy, and are splendidly furnished.

THIRD CLASS ACCOMMODATION

In addition to the up-to-date Music Room and Smoking Room for the accommodation of 3rd class passengers, there is provided, as well as the usual open promenades, a large and airy enclosed promenade the full width of the ship, a great benefit to passengers during wet weather. In the centre of this promenade is an enclosure used as a playground for the children, where they will be happy, safe and comfortable, thus affording tired mothers an opportunity to rest.

Special stewards are appointed to attend to passengers in this class. Meals are served on permanent tables with white table cloths, and the cups and plates and eating utensils are washed and kept clean by the stewards in charge of them.

Each steamer carries an experienced surgeon, and a stewardess to attend to the women and children.

The provisions supplied are of the very best quality. They are examined when put on board by His Majesty's Emigration Officers.

Tickets and all information from any railway or steamship agent

Branches at COBALT and LATCHFORD, in the silver mining camp of New Ontario.

PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement

The price of prospecting licenses is $5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only $2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, $10.00 per acre, and on lands situate less than 20 miles from such a railway, $20.00 per acre:

Superficial products and building materials are sold $2 and $4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed lands; work must be bona fide begun within two years and $500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of $10.00 and a rent of $1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

The Hon. Minister of Colonization, Mines and Fisheries,
Parliament Buildings, Quebec.

The Canadian Miner's Buying Directory.

SEE INDEX TO ADVERTISERS PAGE XXVIII.

Before purchasing supplies, machinery or equipment, consult the firms mentioned in this Directory. They are prepared to fill your order with all possible despatch. If requiring anything not listed in these columns, address THE CANADIAN MINING JOURNAL and you will be put in touch with responsible firms. In writing advertisers, kindly mention this Journal.

Dominion of Canada

SYNOPSIS OF CANADIAN NORTH-WEST MINING REGULATIONS

COAL—Coal mining rights may be leased for a period of 21 years at an annual rental of $1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

QUARTZ—A person 18 years of age, or over, having discovered mineral in place, may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is $5.

At least $100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When $500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at $1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee $5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental $10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds $10,000.

W. W. CORY,

Deputy of the Minister of the Interior

N.B.—Unauthorized publication of this advertisement will not be paid for.

Mining Men's Clothes

Have you experienced the comfort, convenience and economy of shopping by mail from this big modern store? You can do so very easily. No matter in what part of the broad Dominion you live, so long as the Canadian postal service can reach you, you may do your shopping from this store and reap the benefit of our "home prices."

Write your order plainly and fully. Address your envelope plainly and fully, enclose the money and mail it to us. That is all you have to do.

When your letter comes your parcel is made up, checked and shipped with as little delay as is necessary for accuracy, in a department where thousands of such parcels are handled every day.

Our Fall and Winter Catalogue is ready for mailing on the first of September. Send us your name and address and we will gladly mail you one and put you on the list for all subsequent catalogues. Our new Catalogue for 1908 is a complete price list of nearly every article of merchandise to be found in the store. A veritable hand-book of information for housekeepers and a thing of interest for everybody who has buying to do and money to spend. Write for it now so as we can have your name on the list in time for the first mailing.

Here are "Specials" for mining men, prospectors, and all readers of this paper who have heavy work to do or rough journeys to make.

Clothing "Specials"

to readers of this paper

1100 strong, serviceable English, Canadian and Scotch tweed suits, also English corduroy, suitable for business or town wear as well as for men who need strong clothes. Weights are medium and heavy. Regular prices run from $10.00 to $14.00. Sizes 35 to 44. We offer these suits to readers of this paper for **$7.95**

150 Rubberized Waterproof Rain Coats, made of English covert cloth, grey and fawn, seams sewn and taped, strong, neat, comfortable, nothing sticky about them. Sizes, from 36 to 44. Regular $7.50, $8 and $8.50. Special to readers of this paper **$5.00**

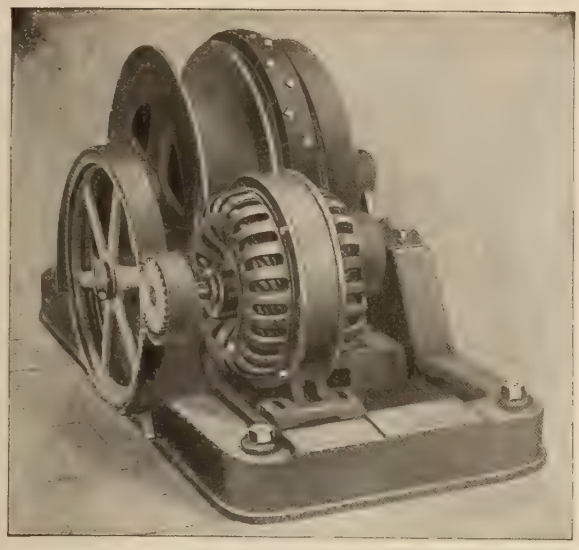
1,000 pairs Moleskin Working Trousers, grey and black, strongest trousers made. Sizes, 32 to 42 inch waist. Special to readers of this paper ..... **.90**

500 Working Jackets, of striped moleskin and duck in khaki, brown and slate. Regularly $2.00 apiece. Special to readers of this paper **$1.25**

Underwear, Shirts, etc.

Men's Heavy Scotch Wool and Fleece Lined Underwear, guaranteed unshrinkable, non-irritating, overlocked seams, elastic ribbed cuffs and ankles. Sizes 34 to 46. Regular value, 90c. garment, per garment ..... **.69**

500 Men's Heavy Khaki Duck Mining Shirts, collars, pockets, have patent fasteners, large roomy shirts, wind and rain proof. Sizes, 14 to 17½. Special ..... **.89**



Men's English Cardigan Jackets and Golf Coats, three pockets, guaranteed all worsted, fast color. Sizes, small, medium and large. Regular value $4.00 and $5.00. Each **$2.98**

Men's Heavy Elastic Web Suspenders, strongly sewn, made with unbreakable cast off leather ends, Police-Firemen style. Our price 50c. Each ..... **.39**

Men's Heavy Tweed Shirts with collar and pocket, generously made, double stitched throughout, also a few heavy Mackinaws and black Drills in the lot. Sizes 14 to 18. Regular value, $1.25, $1.50, $1.75, $2 00. Each.. **.89**

THE ROBERT **SIMPSON** COMPANY, LIMITED | **Toronto** Canada

Westinghouse Motor--Drive

For Mines

There is no other method by which mine apparatus can be so efficiently operated. It allows machines being moved about at will and relocated with the greatest ease, and of their being controlled from any convenient point. There is practically no loss in power transmission.
